SPRS717F - OCTOBER 2011 - REVISED APRIL 2013

Sitara™ AM335x ARM® Cortex™-A8 Microprocessors (MPUs)

Check for Samples: AM3359, AM3358

1 Device Summary

1.1 Features

- Highlights
 - Up to 1-GHz Sitara[™] ARM[®] Cortex[™]-A8
 32-Bit RISC Microprocessor
 - NEON™ SIMD Coprocessor
 - 32KB of L1 Instruction and 32KB Data Cache with Single-Error Detection (parity)
 - 256KB of L2 Cache with Error Correcting Code (ECC)
 - mDDR(LPDDR), DDR2, DDR3, DDR3L Support
 - General-Purpose Memory Support (NAND, NOR, SRAM) Supporting Up to 16-bit ECC
 - SGX530 3D Graphics Engine
 - LCD and Touchscreen Controller
 - Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)
 - Real-Time Clock (RTC)
 - Up to Two USB 2.0 High-Speed OTG Ports with Integrated PHY
 - 10, 100, 1000 Ethernet Switch Supporting Up to Two Ports
 - Serial Interfaces Including:
 - Two Controller Area Network Ports (CAN)
 - Six UARTs, Two McASPs, Two McSPI, and Three I2C Ports
 - 12-Bit Successive Approximation Register (SAR) ADC
 - Up to Three 32-Bit Enhanced Capture Modules (eCAP)
 - Up to Three Enhanced High-Resolution PWM Modules (eHRPWM)
 - Crypto Hardware Accelerators (AES, SHA, PKA, RNG)
- MPU Subsystem
 - Up to 1-GHz ARM[®] Cortex[™]-A8 32-Bit RISC Microprocessor
 - NEON™ SIMD Coprocessor
 - 32KB of L1 Instruction Cache with Single-Error Detection (parity)

- 32KB of L1 Data Cache with Single Error-Detection (parity)
- 256KB of L2 Cache with Error Correcting Code (ECC)
- 176KB of On-Chip Boot ROM
- 64KB of Dedicated RAM
- Emulation and Debug
 - JTAG
- Interrupt Controller (up to 128 interrupt requests)
- On-Chip Memory (Shared L3 RAM)
 - 64 KB of General-Purpose On-Chip Memory Controller (OCMC) RAM
 - Accessible to all Masters
 - Supports Retention for Fast Wake-Up
- External Memory Interfaces (EMIF)
 - mDDR(LPDDR), DDR2, DDR3, DDR3L
 Controller:
 - mDDR: 200-MHz Clock (400-MHz Data Rate)
 - DDR2: 266-MHz Clock (532-MHz Data Rate)
 - DDR3: 400-MHz Clock (800-MHz Data Rate)
 - DDR3L: 400-MHz Clock (800-MHz Data Rate)
 - 16-Bit Data Bus
 - 1 GB of Total Addressable Space
 - Supports One x16 or Two x8 Memory Device Configurations
 - General-Purpose Memory Controller (GPMC)
 - Flexible 8-Bit and 16-Bit Asynchronous Memory Interface with Up to seven Chip Selects (NAND, NOR, Muxed-NOR, SRAM)
 - Uses BCH Code to Support 4-Bit, 8-Bit, or 16-Bit ECC
 - Uses Hamming Code to Support 1-Bit ECC
 - Error Locator Module (ELM)
 - Used in Conjunction with the GPMC to

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Sitara, SmartReflex, DSP/BIOS, XDS are trademarks of Texas Instruments.

Cortex, NEON are trademarks of ARM Ltd or its subsidiaries.

ARM is a registered trademark of ARM Ltd or its subsidiaries.

EtherCAT is a registered trademark of EtherCAT Technology Group.

POWERVR SGX is a trademark of Imagination Technologies Limited.

All other trademarks are the property of their respective owners.

- Locate Addresses of Data Errors from Syndrome Polynomials Generated Using a BCH Algorithm
- Supports 4-Bit, 8-Bit, and 16-Bit per 512byte Block Error Location Based on BCH Algorithms
- Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)
 - Supports protocols such as EtherCAT[®], PROFIBUS, PROFINET, EtherNet/IP™, and more
 - Peripherals Inside the PRU-ICSS
 - One UART Port with Flow Control Pins, Supports Up to 12 Mbps
 - Two MII Ethernet Ports that Support Industrial Ethernet, such as EtherCAT
 - One MDIO Port
 - One Enhanced Capture (eCAP) Module
- Power Reset and Clock Management (PRCM) Module
 - Controls the entry and Exit of Stand-By and Deep-Sleep Modes
 - Responsible for Sleep Sequencing, Power Domain Switch-Off Sequencing, Wake-Up Sequencing and Power Domain Switch-On Sequencing
 - Clocks
 - Integrated 15-35 MHz High-Frequency Oscillator Used to Generate a Reference Clock for Various System and Peripheral Clocks
 - Supports Individual Clock Enable and Disable Control for Subsystems and Peripherals to Facilitate Reduced Power Consumption
 - Five ADPLLs to Generate System Clocks (MPU Subsystem, DDR Interface, USB and Peripherals [MMC and SD, UART, SPI, I2C], L3, L4, Ethernet, GFX [SGX530], LCD Pixel Clock)

Power

- Two Non-Switchable Power Domains (Real-Time Clock [RTC], Wake-Up Logic [WAKE-UP])
- Three Switchable Power Domains (MPU Subsystem [MPU], SGX530 [GFX], Peripherals and Infrastructure [PER])
- Implements SmartReflex[™] Class 2B for Core Voltage Scaling Based On Die Temperature, Process Variation and Performance (Adaptive Voltage Scaling [AVS])
- Dynamic Voltage Frequency Scaling (DVFS)
- Real-Time Clock (RTC)
 - Real-Time Date (Day-Month-Year-Day of

- Week) and Time (Hours-Minutes-Seconds) Information
- Internal 32.768-kHz Oscillator, RTC Logic and 1.1-V Internal LDO
- Independent Power-on-Reset (RTC PWRONRSTn) Input
- Dedicated Input Pin (EXT_WAKEUP) for External Wake Events
- Programmable Alarm Can be Used to Generate Internal Interrupts to the PRCM (for Wake Up) or Cortex-A8 (for Event Notification)
- Programmable Alarm Can be Used with External Output (PMIC_POWER_EN) to Enable the Power Management IC to Restore Non-RTC Power Domains
- Peripherals
 - Up to Two USB 2.0 High-Speed OTG Ports with Integrated PHY
 - Up to Two Industrial Gigabit Ethernet MACs (10, 100, 1000 Mbps)
 - Integrated Switch
 - Each MAC Supports MII, RMII, RGMII and MDIO Interfaces
 - Ethernet MACs and Switch Can Operate Independent of Other Functions
 - IEEE 1588v2 Precision Time Protocol (PTP)
 - Up to Two Controller-Area Network (CAN)
 Ports
 - Supports CAN Version 2 Parts A and B
 - Up to Two Multichannel Audio Serial Ports (McASP)
 - Transmit and Receive Clocks Up to 50 MHz
 - Up to Four Serial Data Pins per McASP Port with Independent TX and RX Clocks
 - Supports Time Division Multiplexing (TDM), Inter-IC Sound (I2S), and similar Formats
 - Supports Digital Audio Interface Transmission (SPDIF, IEC60958-1, and AES-3 Formats)
 - FIFO Buffers for Transmit and Receive (256 bytes)
 - Up to Six UARTs
 - All UARTs Support IrDA and CIR Modes
 - All UARTs Support RTS and CTS Flow Control
 - UART1 Supports Full Modem control
 - Up to Two Master and Slave McSPI Serial Interfaces
 - Up to Two Chip Selects
 - Up to 48 MHz
 - Up to Three MMC, SD, and SDIO Ports

- 1-Bit, 4-Bit and 8-Bit MMC, SD, and SDIO Modes
- MMCSD0 has dedicated Power Rail for 1.8-V or 3.3-V Operation
- Up to 48-MHz Data Transfer Rate
- Supports Card Detect and Write Protect
- Complies with MMC4.3 and SD and SDIO 2.0 Specifications
- Up to Three I2C Master and Slave Interfaces
 - Standard Mode (up to 100 kHz)
 - Fast Mode (up to 400 kHz)
- Up to Four Banks of General-Purpose IO (GPIO)
 - 32 GPIOs per Bank (Multiplexed with Other Functional Pins)
 - GPIOs Can be Used as Interrupt Inputs (Up to Two Interrupt Inputs per Bank)
- Up to Three External DMA Event Inputs That Can Also be Used as Interrupt Inputs
- Eight 32-Bit General-Purpose Timers
 - DMTIMER1 is a 1-ms Timer Used for Operating System (OS) Ticks
 - DMTIMER4 DMTIMER7 are Pinned Out
- One Watchdog Timer
- SGX530 3D Graphics Engine
 - Tile-Based Architecture Delivering Up to 20 Million Polygons per second
 - Universal Scalable Shader Engine is a Multi-Threaded Engine Incorporating Pixel and Vertex Shader Functionality
 - Advanced Shader Feature Set in Excess of Microsoft VS3.0, PS3.0 and OGL2.0
 - Industry Standard API Support of Direct3D Mobile, OGL-ES 1.1 and 2.0, OpenVG 1.0, and OpenMax
 - Fine-Grained Task Switching, Load Balancing and Power Management
 - Advanced Geometry DMA Driven Operation for Minimum CPU Interaction
 - Programmable High-Quality Image Anti-Aliasing
 - Fully Virtualized Memory Addressing for OS Operation in a Unified Memory Architecture
- LCD Controller
 - Up to 24-Bits Data Output; 8-Bits per Pixel (RGB)
 - Resolution Up to 2048x2048 (With Maximum 126-MHz Pixel Clock)
 - Integrated LCD Interface Display Driver (LIDD) Controller
 - Integrated Raster Controller
 - Integrated DMA Engine to Pull Data from the External Frame Buffer without Burdening the Processor via Interrupts or

- a Firmware Timer
- 512-Word Deep Internal FIFO
- Supported Display Types:
 - Character Displays Uses LCD Interface Display Driver (LIDD)
 Controller to Program these Displays
 - Passive Matrix LCD Displays Uses LCD Raster Display Controller to Provide Timing and Data for Constant Graphics Refresh to a Passive Display
 - Active Matrix LCD Displays Uses External Frame Buffer Space and the Internal DMA Engine to Drive Streaming Data to the Panel
- 12-Bit Successive Approximation Register (SAR) ADC
 - 200K Samples per Second
 - Input Can be Selected from any of the Eight Analog Inputs Multiplexed Through an 8:1 analog Switch
 - Can be Configured to Operate as a 4-wire,
 5-wire, or 8-wire Resistive Touch Screen
 Controller (TSC) Interface
- Up to Three 32-Bit Enhanced Capture Modules (eCAP)
 - Configurable as Three Capture Inputs or Three Auxiliary PWM Outputs
- Up to Three Enhanced High-Resolution PWM Modules (eHRPWM)
 - Dedicated 16-Bit Time-Base Counter with Time and Frequency Controls
 - Configurable as Six Single-Ended, Six Dual-Edge Symmetric, or Three Dual-Edge Asymmetric Outputs
- Up to Three 32-Bit Enhanced Quadrature Encoder Pulse (eQEP) Modules
- Device Identification
 - Contains Electrical fuse Farm (FuseFarm) of Which Some Bits are Factory Programmable
 - Production ID
 - Device Part Number (Unique JTAG ID)
 - Device Revision (readable by Host ARM)
- Debug Interface Support
 - JTAG and cJTAG for ARM (Cortex-A8 and PRCM), PRU-ICSS Debug
 - Supports Device Boundary Scan
 - Supports IEEE 1500
- DMA
 - On-Chip Enhanced DMA Controller (EDMA)
 has Three Third-Party Transfer Controllers
 (TPTC) and One Third-Party Channel
 Controller (TPCC), Which Supports Up to 64
 Programmable Logical Channels and Eight
 QDMA Channels. EDMA is Used for:
 - Transfers to and from On-Chip Memories

- Transfers to and from External Storage (EMIF, General-Purpose Memory Controller, Slave Peripherals)
- Inter-Processor Communication (IPC)
 - Integrates Hardware-Based Mailbox for IPC and Spinlock for Process Synchronization Between the Cortex-A8, PRCM, and PRU-
 - **Mailbox Registers that Generate** Interrupts
 - Four Initiators (Cortex-A8, PRCM, PRU0, PRU1)
 - Spinlock has 128 Software-Assigned **Lock Registers**

- Home and Industrial Automation
- cions
 Peripherals
 And Industrial A
 Sumer Medical Appl
 Pinters
 Smart Toll Systems
 Parish
 Paris **Consumer Medical Appliances**

- Security
 - Crypto Hardware Accelerators (AES, SHA, PKA, RNG) ____
- **Boot Modes**
 - Boot Mode is Selected via Boot Configuration Pins Latched on the Rising Edge of the PWRONRSTn Reset Input Pin
- Packages:
 - 298-Pin S-PBGA-N298 Via Channel™ package (ZCE Suffix), 0.65-mm Ball Pitch
 - 324-Pin S-PBGA-N324 package (ZCZ Suffix), 0.80-mm Ball Pitch
- MURATIRKAN 2023-11 ANN 3352 MPU

JAN 2023-11 AN 3352 MPU

1.3 Description

The AM335x microprocessors, based on the ARM Cortex-A8, are enhanced with image, graphics processing, peripherals and industrial interface options such as EtherCAT and PROFIBUS. The device supports the following high-level operating systems (HLOSs) that are available free of charge from TI:

- Linux[®]
- Android™

The AM335x microprocessor contains these subsystems:

- Microprocessor unit (MPU) subsystem based on the ARM Cortex-A8 microprocessor.
- POWERVR SGX[™] Graphics Accelerator subsystem for 3D graphics acceleration to support display and gaming effects.
- The Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS) is separate from the ARM core, allowing independent operation and clocking for greater efficiency and flexibility. The PRU-ICSS enables additional peripheral interfaces and real-time protocols such as EtherCAT, PROFINET, EtherNet/IP, PROFIBUS, Ethernet Powerlink, Sercos, and others.

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Chang | ges from Revision E (January 2013) to Revision F | age |
|----------|---|--------------|
| • | Changed device status to Production Data | 1 |
| • (| Changed ARM speeds features list item | . 1 |
| | Changed MPU Subsystem speeds features list item | . 1 |
| 2 | Changed Features list item for DDR3 | . 1 |
| \ | Changed Features list item for DDR3L | |
| • | Changed Figure 1-1, AM335x Functional Block Diagram | 6 |
| • | Changed Type value to I for Mode 2 (uart5_rxd) in Table 2-7, Ball Characteristics (ZCE and ZCZ Packages) | 37 |
| • | Added Footnote (3) in Table 2-7, Ball Characteristics (ZCE and ZCZ Packages) | |
| • | Changed Footnote (4) in Table 2-7, Ball Characteristics (ZCE and ZCZ Packages) | |
| • | Added RTC_PORz Signal Name to Table 2-17, Miscellaneous/Miscellaneous Signals Description | |
| • | Deleted ESD-CDM (Charged-Device Model) Corner Terminals Parameter and changed MIN value for Latch-up | |
| | Performance Parameter in Table 3-1 | 80 |
| • | Changed DDR3, DDR3L value for OPP100 and deleted Footnote (3) in Table 3-2, VDD_CORE Operating | |
| | Performance Points for ZCZ Package with Device Revision Code "Blank" | 82 |
| • | Deleted OPP50 row from Table 3-3, VDD_MPU Operating Performance Points for ZCZ Package with Device | |
| | Revision Code "Blank" | 82 |
| • | Added Table 3-4, Valid Combinations of VDD_CORE and VDD_MPU Operating Performance Points for ZCZ | |
| | Package with Device Revision Code "Blank" | 82 |
| • | Changed DDR3, DDR3L value for OPP100, deleted Footnote (4) and deleted OPP50 row from Table 3-5, | |
| | VDD_CORE Operating Performance Points for ZCE Package with Device Revision Code "Blank" | 83 |
| • | Changed DDR3, DDR3L value for OPP100 and deleted Footnote (3) in Table 3-6, VDD_CORE Operating | |
| | | 84 |
| • | Changed Table 3-7, VDD_MPU Operating Performance Points for ZCZ Package with Device Revision Code "A" | |
| | or Newer 5 | 84 |
| • | Added Table 3-8, Valid Combinations of VDD_CORE and VDD_MPU Operating Performance Points for ZCZ | |
| | Package with Device Revision Code "A" or Newer | . <u>8</u> 4 |
| • , | Changed DDR3, DDR3L value for OPP100 and deleted Footnote (4) in Table 3-9, VDD_CORE Operating | 0. |
| | Performance Points for ZCE Package with Device Revision Code "A" or Newer | 85 |
| 6. | Added VDD_MPU Nitro Description and MAX value in Table 3-10, Maximum Current Ratings at AM335x Power | 0.0 |
| // | Terminals | 86 |
| • | Terminals | . 86 |
| • | Added paragraphs in the POH section before and after Table 3-11, Reliability Data | |
| • | Added Operating Condition Nitro to Table 3-11, Reliability Data | |
| • | Added MIN, NOM, and MAX for VDD_MPU Nitro mode; deleted values from USB0_ID and USB1_ID; added | <u>01</u> |
| | Footnote (7) in Table 3-12, Recommended Operating Conditions | 87 |
| • | Changed V _{OH} , V _{OL} , I _I and I _{OZ} Parameter values in Table 3-13, DC Electrical Characteristics Over Recommended | <u> </u> |
| | Ranges of Supply Voltage and Operating Temperature | 90 |
| • | | 92 |
| • | Changed second paragraph in Section 4.2.2.3, OSC1 Internal Oscillator Clock Source | |
| • | | 112 |
| • | Added Section 5.4, DMTimer | 117 |
| • | Added OPP50 MIN values for all parameters and changed OPP100 MIN value for Parameters F13 and F22 in | |
| | Table 5-21, GPMC and NOR Flash Timing Requirements—Synchronous Mode | 126 |
| • | Added OPP50 MIN and MAX values and changed MIN values of OPP100 Parameters F7 and F8 in Table 5-22, | |
| | | 127 |
| • | Changed OPP50 MIN and MAX Parameter values in Table 5-26, GPMC and NOR Flash Switching | |
| | Characteristics—Asynchronous Mode | 136 |
| • | Changed OPP50 MIN and MAX Parameter values in Table 5-30, GPMC and NAND Flash Switching | |
| | Characteristics—Asynchronous Mode | 145 |
| • | | 170 |
| • | Added Conditions to Parameter 1 and deleted Footnote in Table 5-58, Compatible JEDEC DDR3 Devices (Per | |
| , 5 | Interface) | 174 |
| 1 | Changed Footnote (12) in Table 5-66, CK and ADDR_CTRL Routing Specification | |
| < 10° | Changed Footnote (11) in Table 5-67. DQS[x] and DQ[x] Routing Specification | 188 |

2.2 Ball Characteristics

The AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73) and this document may reference internal signal names when discussing peripheral input and output signals since many of the AM335x package terminals can be multiplexed to one of several peripheral signals. The following table has a Pin Name column that lists all device terminal names and a Signal Name column that lists all internal signal names multiplexed to each terminal which provides a cross reference of internal signal names to terminal names. This table also identifies other important terminal characteristics.

- 1. BALL NUMBER: Package ball numbers associated with each signals.
- PIN NAME: The name of the package pin or terminal.
 Note: The table does not take into account subsystem terminal multiplexing options.
- 3. SIGNAL NAME: The signal name for that pin in the mode being used.
- 4. MODE: Multiplexing mode number.
 - (a) Mode 0 is the primary mode; this means that when mode 0 is set, the function mapped on the terminal corresponds to the name of the terminal. There is always a function mapped on the primary mode. Notice that primary mode is not necessarily the default mode.

Note: The default mode is the mode at the release of the reset; also see the RESET REL. MODE column.

- (b) Modes 1 to 7 are possible modes for alternate functions. On each terminal, some modes are effectively used for alternate functions, while some modes are not used and do not correspond to a functional configuration.
- 5. TYPE: Signal direction
 - I = Input
 - O ∋ Output
 - _\O = Input and Output
 - D = Open drain
 - DS = Differential
 - A = Analog
 - PWR = Power
 - GND = Ground

Note: In the safe_mode, the buffer is configured in high-impedance.

- 6. BALL RESET STATE: State of the terminal while the active low PWRONRSTn terminal is low.
 - 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
 0(PD): The buffer drives V_{OL} with an active pulldown resistor
 - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
 1(PU): The buffer drives V_{OH} with an active pullup resistor
 - Z: High-impedance
 - L: High-impedance with an active pulldown resistor
 - H: High-impedance with an active pullup resistor
- 7. **BALL RESET REL. STATE:** State of the terminal after the active low PWRONRSTn terminal transitions from low to high.
 - 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
 0(PD): The buffer drives V_{OL} with an active pulldown resistor
 - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
 1(PU): The buffer drives V_{OH} with an active pullup resistor
 - Z:High-impedance.
 - L: High-impedance with an active pulldown resistor
 - H: High-impedance with an active pullup resistor
- 8. **RESET REL. MODE:** The mode is automatically configured after the active low PWRONRSTn terminal transitions from low to high.

- 9. **POWER:** The voltage supply that powers the terminal's IO buffers.
- 10. HYS: Indicates if the input buffer is with hysteresis.
- 11. BUFFER STRENGTH: Drive strength of the associated output buffer.
- 12. **PULLUP OR PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
- 13. IO CELL: IO cell information.

MIRATIRKAN 2023-11 ANN 352 MPU

Note: Configuring two terminals to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration.

SPRS717F - OCTOBER 2011 - REVISED APRIL 2013 www.ti.com

- (1) An internal 10 kohm pull up is turned on when the oscillator is diasabled. The oscillator is disabled by default after power is applied.
- (2) An internal 15 kohm pull down is turned on when the oscillator is disabled. The oscillator is enabled by default after power is applied.
- (3) Do not connect anything to this terminal.
- (4) If sysboot[5] is low on the rising edge of PWRONRSTn, this terminal has an internal pull-down turned on after reset is released. If sysboot[5] is high on the rising edge or PWRONRSTn. this terminal will initially be driven low after reset is released then it begins to toggle at the same frequency of the XTALIN terminal.
- (5) LCD DATA[15:0] terminals are respectively SYSBOOT[15:0] inputs, latched on the rising edge of PWRONRSTn.
- Mode1 and Mode2 signal assignments for this terminal are only available with silicon revision 2.0 or newer devices
- (7) Mode2 signal assignment for this terminal is only available with silicon revision 2.0 or newer devices.
- Refer to the External Warm Reset section of the AM335x Technical Reference Manual for more information related to the operation of this terminal.
- (9) Reset Release Mode = 7 if sysboot[5] is low. Mode = 3 if sysboot[5] is high.
- (10) Silicon revision 1.0 devices only provide the MMC2_DAT7 signal when Mode3 is selected. Silicon revision 2.0 and newer devices implement another level of pin multiplexing which provides the original MMC2_DAT7 signal or RMII2_CRS_DV signal when Mode3 is selected. This new level of of pin multiplexing is selected with bit zero of the SMA2 register. For more details refer to Section 1.2 of the AM335x Technical Reference Manual.
- (11) The input voltage thresholds for this input are not a function of VDDSHV6. Please refer to the DC Electrical Characteristics section for details related to electrical parameters associated with this input terminal.
- (12) The internal USB PHY can be configured to multiplex the UART2 TX or UART2 RX signals to this terminal. For more details refer to USB GPIO Details section of the AM335x Technical
- (13) The internal USB PHY can be configured to multiplex the UART3_TX or UART3_RX signals to this terminal. For more details refer to USB GPIO Details section of the AM335x Technical Reference Manual.
- (14) This output should only be used to source the recommended crystal circuit.
- (15) This parameter only applies when this USB PHY terminal is operating in UART2 mode.
- (16) This parameter only applies when this USB PHY terminal is operating in UART3 mode.
- (17) This terminal is a analog input used to set the switching threshold of the DDR input buffers to (VDDS_DDR / 2).
- (18) This terminal is a analog passive signal that connects to an external 49.9 ohm 1%, 20mW reference resistor which is used to calibrate the DDR input/output buffers.
- (19) This terminal is analog input that may also be configured as an open-drain output.
- (20) This terminal is analog input that may also be configured as an open-source or open-drain output.
- (21) This terminal is analog input that may also be configured as an open-source output.
- (22) This terminal is high-Z when the oscillator is diasabled. This terminal is driven high if RTC_XTALIN is less than VIL, driven low if RTC_XTALIN is greater than VIH, and driven to a unknown value if RTC XTALIN is between VIL and VIH when the oscillator is enabled. The oscillator is disabled by default after power is applied.
- (23) This terminal is high-Z when the oscillator is diasabled. This terminal is driven high if XTALIN is less than VIL, driven low if XTALIN is greater than VIH, and driven to a unknown value if XTALIN is between VIL and VIH when the oscillator is enabled. The oscillator is enabled by default after power is applied.
- (24) This terminal requires two power supplies, VDDA3p3v USB0 and VDDA1p8v USB0. The "*" character in the power supply name is a wild card that represents "3p3v" and "1p8v".
- (25) This terminal requires two power supplies, VDDA3p3v_USB1 and VDDA1p8v_USB1. The "*" character in the power supply name is a wild card that represents "3p3v" and "1p8v".
- (26) This power rail is connected to VDD CORE in the ZCE package.
- (27) This terminal provides a Kelvin connection to VDD MPU. It can be connected to the power supply feedback input to provide remote sensing which compensates for voltage drop in the PCB power distribution network and package. When the Kelvin connection is not used it should be connected to the same power source as VDD MPU.
- (28) This terminal provides a Kelvin ground reference for the external crystal components. If a crystal circuit is connected to the RTC_XTALIN/RTC_XTALOUT terminals, the crystal circuit component grounds should only be connected to this terminal and should not be connected to the PCB ground plane. If an external LVCMOS clock source is connected to the XTALIN terminal, this terminal should be connected to VSS.
- (29) This terminal provides a Kelvin ground reference for the external crystal components. If a crystal circuit is connected to the XTALIN/XTALOUT terminals, the crystal circuit component

SPRS717F - OCTOBER 2011-REVISED APRIL 2013

www.ti.com

grounds should only be connected to this terminal and should not be connected to the PCB ground plane. If an external LVCMOS clock source is connected to the XTALIN terminal, this Lted to Lted t terminal should be connected to VSS.

2.3 Signal Description

MIRATIRKAM 2023-11 AM 3352 MPU

The AM335x device contains many peripheral interfaces. In order to reduce package size and lower overall system cost while maintaining maximum functionality, many of the AM335x terminals can multiplex up to eight signal functions. Although there are many combinations of pin multiplexing that are possible, only a certain number of sets, called IO Sets, are valid due to timing limitations. These valid IO Sets were carefully chosen to provide many possible application scenarios for the user.

Texas Instruments has developed a Windows-based application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their AM335x-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pin-multiplexing configuration selected for a design only uses valid IO Sets supported by the AM335x device.

MURATIRKAN 2023-11 ANN 352 MPU

(1) SIGNAL NAME: The signal name

(2) **DESCRIPTION:** Description of the signal

(3) TYPE: Ball type for this specific function:

I = Input

O = Output

- I/O = Input/Output

– D = Open drain

DS = Differential A = Analog

(4) BALL: Package ball location

| VDDSHV2 ⁽⁶⁾ | Supply voltage range for the dual-voltage IO domain | -0.5 3.8 | V |
| VDDSHV3 ⁽⁶⁾ | Supply voltage range for the dual-voltage IO domain | -0.5 3.8 | V |
| VDDSHV4 | Supply voltage range for the dual-voltage IO domain | -0.5 3.8 | V |
| VDDSHV5 | Supply voltage range for the dual-voltage IO domain | -0.5 3.8 | V |
| VDDSHV6 | Supply voltage range for the dual-voltage IO domain | -0.5 3.8 | V |
| VDDA3P3V_USB0 | Supply voltage range for USBPHY | -0.5 4 | V |
| VDDA3P3V_USB1 ⁽⁶⁾ | Supply voltage range for USBPHY | -0.5 4 | V |
| USB0_VBUS ⁽⁷⁾ | Supply voltage range for USB VBUS comparator input | -0.5 5.25 | V |
| USB1_VBUS ⁽⁶⁾⁽⁷⁾ | Supply voltage range for USB VBUS comparator input | -0.5 5.25 | V |
| DDR_VREF | Supply voltage range for the DDR SSTL and HSTL reference voltage | -0.3 1.1 | V |
| Steady State Max. Voltage at all IO pins ⁽⁸⁾ | | -0.5V to IO supply voltage + 0.3 V | • |
| USB0_ID ⁽⁹⁾ | Steady state maximum voltage range for the USB ID input | -0.5 2.1 | V |
| USB1_ID ⁽⁶⁾⁽⁹⁾ | Steady state maximum voltage range for the USB ID input | -0.5 2.1 | V |
| Transient Overshoot and Undershoot specification at IO terminal | ONE | 25% of corresponding IO supply voltage for up to 30% of signal period | |
| Storage temperature range, $T_{stg}^{(10)}$ | 250 | -55 | °C |
| Electrostatic Discharge | ESD-HBM (Human Body Model)(11) | ±2000 | \/ |
| (ESD) Performance | ESD-CDM (Charged-Device Model) ⁽¹²⁾ | ±500 | V |
| Latch-up Performance ⁽¹³⁾ | Class II (105°C) | 45 | mA |

⁽¹⁾ Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Device Operating Conditions

Copyright © 2011–2013, Texas Instruments Incorporated

⁽²⁾ All voltage values are with respect to their associated VSS or VSSA_x.

⁽³⁾ Not available on the ZCE package. VDD_MPU is merged with VDD_CORE on the ZCE package.

⁽⁴⁾ This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced

www.ti.com

from an external power supply.

- (5) During functional operation, this pin is a no connect.
- (6) Not availabe on the ZCE package.
- (7) This terminal is connected to a fail-safe IO and does not have a dependence on any IO supply voltage.
- (8) This parameter applies to all IO terminals which are not fail-safe and the requirement applies to all values of IO supply voltage. For example, if the voltage applied to a specific IO supply is 0 volts the valid input voltage range for any IO powered by that supply will be -0.5 to +0.3 volts. Special attention should be applied anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.
- (9) This terminal is connected to analog circuits in the respective USB PHY. The circuit sources a known current while measuring the voltage to determine if the terminal is connected to VSSA_USB with a resistance less than 10 Ω or greater than 100 kΩ. The terminal should be connected to ground for USB host operation or open-circuit for USB peripheral operation, and should never be connected to any external voltage source.
- (10) For tape and reel the storage temperature range is [-10°C; +50°C] with a maximum relative humidity of 70%. It is recommended returning to ambient room temperature before usage.
- (11) Based on JEDEC JESD22-A114E [Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)].
- (12) Based on JEDEC JESD22-C101C (Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components).
- (13) Based on JEDEC JESD78D [IC Latch-Up Test].

Fail-safe IO terminals are designed such they do not have dependencies on the respective IO power supply voltage. This allows external voltage sources to be connected to these IO terminals when the respective IO power supplies are turned off. The USBO_VBUS and USB1_VBUS are the only fail-safe IO terminals. All other IO terminals are not fail-safe and the voltage applied to them should be limited to the value defined by the **Steady State Max. Voltage at all IO pins** parameter in Table 3-1.

Recommended Operating Conditions

Device Operating Performance Points are defined in Table 3-2 through Table 3-9

Table 3-2. VDD_CORE Operating Performance Points for ZCZ Package with Device Revision Code "Blank"

| VDD_CORE | | VDD_CORE | | IP | | | |
|-------------------------------|---------|----------|---------|-------------------------------|---------------------|---------------------|------------------------|
| OPP Device Rev. "Blank" | MIN | NOM | MAX | DDR3, DDR3L ⁽²⁾ | DDR2 ⁽²⁾ | mDDR ⁽²⁾ | L3 and L4 |
| OPP100 | 1.056 V | 1.100 V | 1.144 V | 400 MHz | 266 MHz | 200 MHz | 200 MHz and 100 MHz |
| OPP50 | 0.912 V | 0.950 V | 0.988 V | - | 125 MHz | 90 MHz | 100 MHz and 50 MHz |

⁽¹⁾ Frequencies in this table indicate maximum performance for a given OPP condition.

Table 3-3. VDD_MPU Operating Performance Points for ZCZ Package with Device Revision Code "Blank"(1)

| VDD_MPU OPP | | VDD_MPU | | ADM (AO) |
|-----------------------|---------|---------|---------|----------|
| Device Rev. "Blank" | MIN NOM | | MAX | ARM (A8) |

⁽²⁾ This parameter represents the maximum memory clock frequency. Since data is transferred on both edges of the clock, double-data rate (DDR), the maximum data rate is two times the maximum memory clock frequency defined in this table.

⁽²⁾ Applies to all orderable AM335_ZCZ_50 (500-MHz speed grade) or higher devices.

⁽³⁾ Applies to all orderable AM335_ZCZ_27 (275-MHz speed grade) devices. MURATIRKA

⁽¹⁾ Current ratings specified in this table are worst-case estimates. Actual application power supply estimates could be lower. For more information, see the *AM335x Power Consumption Summary* application report (literature number SPRABN5).

Device Operating Conditions

⁽²⁾ VDD_MPU is merged with VDD_CORE and is not available separately on the ZCE package. The maximum current rating for VDD_CORE on the ZCE package is the sum of VDD_CORE and VDD_MPU shown in this table.

⁽³⁾ This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced from an external power supply.

⁽⁴⁾ Not available on the ZCE package.

⁽⁵⁾ VDDSHV1 and VDDSHV2 are merged in the ZCE package. The maximum current rating for VDDSHV1 on the ZCE package is the sum of VDDSHV1 and VDDSHV2 shown in this table.

The power-on hours (POH) information in Table 3-11 is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

To avoid significant degradation, the device power-on hours (POH) must be limited to the following:

Table 3-11. Reliability Data

| OPERATING | COMMERCIAL | | INDUST | INDUSTRIAL | | DED |
|-----------|------------------------------------|----------------------------------|------------------------------------|----------------------------------|------------------------------------|----------------------------------|
| CONDITION | JUNCTION TEMP (T _j) | LIFETIME (POH) ⁽¹⁾ | JUNCTION TEMP (T _j) | LIFETIME (POH) ⁽¹⁾ | JUNCTION TEMP (T _j) | LIFETIME (POH) ⁽¹⁾ |
| Nitro | 0°C to 90°C | 100K | -40°C to 90°C | 100K | -40°C to 105°C | 37K |
| Turbo | 0°C to 90°C | 100K | -40°C to 90°C | 100K | -40°C to 105°C | 80K |
| OPP120 | 0°C to 90°C | 100K | -40°C to 90°C | 100K | -40°C to 105°C | 100K |
| OPP100 | 0°C to 90°C | 100K | -40°C to 90°C | 100K | -40°C to 105°C | 100K |
| OPP50 | 0°C to 90°C | 100K | -40°C to 90°C | 100K | -40°C to 105°C | 100K |

⁽¹⁾ POH = Power-on hours when the device is fully functional.

NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

The above notations cannot be deemed a warranty or deemed to extend or modify the warranty under TI's standard terms and conditions for TI semiconductor products.

The device is used under the recommended operating conditions described in Table 3-12.

- (1) The supply voltage defined by OPP100 should be applied to this power domain before the device is released from reset.
- (2) Not available on the ZCE package. VDD_MPU is merged with VDD_CORE on the ZCE package.
- (3) This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced from an external power supply.
- (4) VDDS should be supplied irrespective of 1.8-V or 3.3-V mode of operation of the dual-voltage IOs.
- (5) For more details on power supply requirements, see Section 4.1.4.
- (6) Not available on the ZCE package.
- (7) This terminal is connected to analog circuits in the respective USB PHY. The circuit sources a known current while measuring the voltage to determine if the terminal is connected to VSSA_USB with a resistance less than 10 Ω or greater than 100 kΩ. The terminal should be connected to ground for USB host operation or open-circuit for USB peripheral operation, and should never be connected to any external voltage source.

3.4 External Capacitors

To improve module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

3.4.1 Voltage Decoupling Capacitors

Table 3-14 summarizes the Core voltage decoupling characteristics

3.4.1.1 Core Voltage Decoupling Capacitors

To improve module performance, decoupling capacitors are required to suppress high-frequency switching noise and to stabilize the supply voltage. A decoupling capacitor is most effective when located close to the AM335x device, because this minimizes the inductance of the circuit board wiring and interconnects.

Table 3-14. Core Voltage Decoupling Characteristics

| | PARAMETER | TYP | UNIT |
|--|-----------|-------|------|
| C _{VDD_CORE} ⁽¹⁾ | | 10.08 | μF |
| C _{VDD MPU} ⁽²⁾⁽³⁾ | | 10.05 | μF |

- (1) The typical value corresponds to 1 cap of 10 μ F and 8 caps of 10 nF.
- (2) Not available on the ZCE package. VDD_MPU is merged with VDD_CORE on the ZCE package.
- (3) The typical value corresponds to 1 cap of 10 µF and 5 caps of 10 nF.

3.4.1.2 IO and Analog Voltage Decoupling Capacitors

Table 3-15 summarizes the power-supply decoupling capacitor recommendations.

Table 3-15. Power-Supply Decoupling Capacitor Characteristics

| C _{VDDSHV4} ⁽⁵⁾ | 9 | 10.02 | μF |
| C _{VDDSHV5} ⁽⁵⁾ | 201 | 10.02 | μF |
| C _{VDDSHV6} ⁽³⁾ | 2 | 10.06 | μF |

- (1) Not available on the ZCE package.
- (2) Typical values consist of 1 cap of 10 µF and 4 caps of 10 nF.
- (3) Typical values consist of 1 cap of 10 µF and 6 caps of 10 nF.
- (4) For more details on decoupling capacitor requirements for the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface, see Section 5.6.2.1.2.6 and Section 5.6.2.1.2.7 when using mDDR(LPDDR) memory devices, Section 5.6.2.2.2.6 and Section 5.6.2.2.2.7 when using DDR2 memory devices, or Section 5.6.2.3.3.6 and Section 5.6.2.3.3.7 when using DDR3 or DDR3L memory devices.
- (5) Typical values consist of 1 cap of 10 μF and 2 caps of 10 nF.

3.4.2 Output Capacitors

Internal low dropout output (LDO) regulators require external capacitors to stabilize their outputs. These capacitors should be placed as close as possible to the respective terminals of the AM335x device. Table 3-16 summarizes the LDO output capacitor recommendations.

Table 3-16. Output Capacitor Characteristics

| PARAMETER | TYP | UNIT |
|---|-----|------|
| C _{CAP_VDD_SRAM_CORE} ⁽¹⁾ | (L) | μF |
| C _{CAP_VDD_RTC} ⁽¹⁾⁽²⁾ | | μF |
| C _{CAP_VDD_SRAM_MPU} ⁽¹⁾ | 1 | μF |
| C _{CAP_VBB_MPU} ⁽¹⁾ | 1 | μF |

(1) LDO regulator outputs should not be used as a power source for any external components.

(2) The CAP_VDD_RTC terminal operates as an input to the RTC core voltage domain when the RTC_KLDO_ENn terminal is high.

MUR

Figure 3-1 illustrates an example of the external capacitors.

- A. Decoupling capacitors must be placed as closed as possible to the power terminal. Choose the ground located closest to the power pin for each decoupling capacitor. In case of interconnecting powers, first insert the decoupling capacitor and then interconnect the powers.
- B. The decoupling capacitor value depends on the board characteristics.

Figure 3-1. External Capacitors

3.5 Touchscreen Controller and Analog-to-Digital Subsystem Electrical Parameters

The touchscreen controller (TSC) and analog-to-digital converter (ADC) subsystem (TSC_ADC) is an 8-channel general-purpose ADC with optional support for interleaving TSC conversions for 4-wire, 5-wire, or 8-wire resistive panels. The TSC_ADC subsystem can be configured for use in one of the following applications:

- 8 general-purpose ADC channels
- 4-wire TSC with 4 general-purpose ADC channels
- 5-wire TSC with 3 general-purpose ADC channels
- 8-wire TSC.

Table 3-17 summarizes the TSC_ADC subsystem electrical parameters.

⁽¹⁾ VREFP and VREFN must be tied to ground if the internal voltage reference is used.

⁽²⁾ This parameter is valid when the respective AIN terminal is configured to operate as a general-purpose ADC input.

4 Power and Clocking

4.1 Power Supplies

4.1.1 Power-Up Sequencing

- A. RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.
- B. When using the ZCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE. The ZCE package option has the VDD_MPU domain merged with the VDD_CORE domain.
- C. If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.
- D. If the system uses mDDR or DDR2 memory devices, VDDS_DDR can be ramped simultaneously with the other 1.8-V IO power supplies.
- E. VDDS_RTC can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If VDDS_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.
- F. To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

Figure 4-1. Preferred Power-Supply Sequencing with Dual-Voltage IOs Configured as 3.3 V

- RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.
- The 3.3-V IO power supplies may be ramped simultaneously with the 1.8-V IO power supplies if the voltage sourced by any 3.3-V power supplies does not exceed the voltage sourced by any 1.8-V power supply by more than 2 V. Serious reliability issues may occur if the system power supply design allows any 3.3-V IO power supplies to exceed any 1.8-V IO power supplies by more than 2 V.
- When using the ZCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE. The ZCE package option has the VDD_MPU domain merged with the VDD_CORE
- If a USB port is not used, the respective VDDA1P8V USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.
- If the system uses mDDR or DDR2 memory devices, VDDS DDR can be ramped simultaneously with the other 1.8-V IO power supplies.
- VDDS_RTC can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If VDDS_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.
- To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

- RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.
- When using the ZCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD MPU and VDD CORE. The ZCE package option has the VDD MPU domain merged with the VDD CORE domain.
- If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.
- If the system uses mDDR or DDR2 memory devices, VDDS DDR can be ramped simultaneously with the other 1.8-V IO power supplies.
- VDDS_RTC can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If VDDS_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD CORE. The power sequence shown provides the lowest leakage option.
- To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

Figure 4-3. Power-Supply Sequencing with Dual-Voltage IOs Configured as 1.8 V

- RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.
- The CAP_VDD_RTC terminal operates as an input to the RTC core voltage domain when the internal RTC LDO is disabled by connecting the RTC_KALDO_ENn terminal to VDDS_RTC. If the internal RTC LDO is disabled, CAP_VDD_RTC should be sourced from an external 1.1-V power supply.
- When using the ZCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE. The ZCE package option has the VDD_MPU domain merged with the VDD_CORE
- If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V USB terminal may be connected to ground.
- If the system uses mDDR or DDR2 memory devices, VDDS DDR can be ramped simultaneously with the other 1.8-V IO power supplies.
- VDDS_RTC should be ramped at the same time or before CAP_VDD_RTC, but these power inputs can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If CAP_VDD_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.
- To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence. Figure 4-4. Power-Supply Sequencing with Internal RTC LDO Disabled

- A. CAP_VDD_RTC terminal operates as an input to the RTC core voltage domain when the internal RTC LDO is disabled by connecting the RTC_KALDO_ENn terminal to VDDS_RTC. If the internal RTC LDO is disabled, CAP_VDD_RTC should be sourced from an external 1.1-V power supply. The PMIC_POWER_EN output cannot be used when the RTC is disabled.
- B. When using the ZCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE. The ZCE package option has the VDD_MPU domain merged with the VDD_CORE domain.
- C. If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.
- D. If the system uses mDDR or DDR2 memory devices, VDDS_DDR can be ramped simultaneously with the other 1.8-V IO power supplies.
- E. VDDS_RTC should be ramped at the same time or before CAP_VDD_RTC, but these power inputs can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If CAP_VDD_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.
- F. To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

Figure 4-5. Power-Supply Sequencing with RTC Feature Disabled

4.1.2 Power-Down Sequencing

PWRONRSTn input terminal should be taken low, which stops all internal clocks before power supplies are turned off. All other external clocks to the device should be shut off.

The preferred way to sequence power down is to have all the power supplies ramped down sequentially in the exact reverse order of the power-up sequencing. In other words, the power supply that has been ramped up first should be the last one that should be ramped down. This ensures there would be no spurious current paths during the power-down sequence. The VDDS power supply must ramp down after all 3.3-V VDDSHVx [1-6] power supplies.

If it is desired to ramp down VDDS and VDDSHVx [1-6] simultaneously, it should always be ensured that the difference between VDDS and VDDSHVx [1-6] during the entire power-down sequence is <2 V. Any violation of this could cause reliability risks for the device. Further, it is recommended to maintain VDDS ≥1.5V as all the other supplies fully ramp down to minimize in-rush currents.

If none of the VDDSHVx [1-6] power supplies are configured as 3.3 V, the VDDS power supply may ramp down along with the VDDSHVx [1-6] supplies or after all the VDDSHVx [1-6] supplies have ramped down. It is recommended to maintain VDDS ≥1.5V as all the other supplies fully ramp down to minimize in-rush currents.

4.1.3 VDD MPU MON Connections

Figure 4-6 shows the VDD_MPU_MON connectivity. VDD_MPU_MON connectivity is available only on the ZCZ package.

Connection for VDD MPU MON if voltage monitoring is used

Preferred connection for VDD_MPU_MON if voltage monitoring is NOT used

Optional connection for VDD_MPU_MON if voltage monitoring is NOT used

Figure 4-6. VDD_MPU_MON Connectivity

4.1.4 Digital Phase-Locked Loop Power Supply Requirements

The digital phase-locked loop (DPLL) provides all interface clocks and functional clocks to the processor of the AM335x device. The AM335x device integrates 5 different DPLLs—Core DPLL, Per DPLL, Display DPLL, DDR DPLL, MPU DPLL.

Figure 4-7 illustrates the power supply connectivity implemented in the AM335x device. Table 4-1 provides the power supply requirements for the DPLL.

Figure 4-7. DPLL Power Supply Connectivity

Table 4-1. DPLL Power Supply Requirements

| SUPPLY NAME | DESCRIPTION | MIN | NOM | MAX | UNITS |
|-------------------|--|------|-----|------|----------|
| VDDA1P8V_USB0 | Supply voltage range for USBPHY and PER DPLL, Analog, 1.8V | 1.71 | 1.8 | 1.89 | V |
| 001 | Max. peak-to-peak supply noise | | | 50 | mV (p-p) |
| VDDS_PLL_MPU | Supply voltage range for DPLL MPU, Analog | 1.71 | 1.8 | 1.89 | V |

| VDDS_PLL_CORE_LCD | Supply voltage range for DPLL CORE and LCD, Analog | 1.71 | 1.8 | 1.89 | V |
| IL. | Max. peak-to-peak supply noise | | | 50 | mV (p-p) |
| VDDS_PLL_DDR | Supply voltage range for DPLL DDR, Analog | 1.71 | 1.8 | 1.89 | V |
| | Max. peak-to-peak supply noise | | | 50 | (a-a) Vm |

4.2 **Clock Specifications**

Input Clock Specifications 4.2.1

The AM335x device has two clock inputs. Each clock input passes through an internal oscillator which can be connected to an external crystal circuit (oscillator mode) or external LVCMOS square-wave digital clock source (bypass mode). The oscillators automatically operate in bypass mode when their input is connected to an external LVCMOS square-wave digital clock source. The oscillator associated with a specific clock input must be enabled when the clock input is being used in either oscillator mode or bypass mode.

The OSC1 oscillator provides a 32.768-kHz reference clock to the real-time clock (RTC) and is connected to the RTC XTALIN and RTC XTALOUT terminals. This clock source is referred to as the 32K oscillator (CLK_32K_RTC) in the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73). OSC1 is disabled by default after power is applied. This clock input is optional and may not be required if the RTC is configured to receive a clock from the internal 32k RC oscillator (CLK_RC32K) or peripheral PLL (CLK_32KHZ) which receives a reference clock from the OSC0 input.

The OSC0 oscillator provides a 19.2-MHz, 24-MHz, 25-MHz, or 26-MHz reference clock which is used to clock all non-RTC functions and is connected to the XTALIN and XTALOUT terminals. This clock source is referred to as the master oscillator (CLK_M_OSC) in the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73). OSC0 is enabled by default after power is applied.

For more information related to recommended circuit topologies and crystal oscillator circuit requirements for these clock inputs, see Section 4.2.2.

4.2.2 Input Clock Requirements

OSC0 Internal Oscillator Clock Source

Figure 4-8 shows the recommended crystal circuit. It is recommended that pre-production printed circuit board (PCB) designs include the two optional resistors Rbias and Rd in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases, R_{bias} is not required and R_d is a 0-Ω resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on pre-production PCBs.

The XTALIN terminal has a 15 - 40 kΩ internal pull-down resistor which is enabled when OSC0 is disabled. This internal resistor prevents the XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.

- Oscillator components (Crystal, C_1 , C_2 , optional R_{bias} and R_d) must be located close to the AM335x package. Parasitic capacitance to the printed circuit board (PCB) ground and other signals should be minimized to reduce noise coupled into the oscillator. The VSS_OSC terminal provides a Kelvin ground reference for the external crystal components. External crystal component grounds should only be connected to the VSS_OSC terminal and should not be connected to the PCB ground plane.
- C₁ and C₂ represent the total capacitance of the respective PCB trace, load capacitor, and other components (excluding the crystal) connected to each crystal terminal. The value of capacitors C1 and C2 should be selected to provide the total load capacitance, C_L , specified by the crystal manufacturer. The total load capacitance is C_L = [(C₁*C₂)/(C₁+C₂)] + C_{shunt}, where C_{shunt} is the crystal shunt capacitance (C₀) specified by the crystal manufacturer plus any mutual capacitance ($C_{pkg} + C_{PCB}$) seen across the AM335x XTALIN and XTALOUT signals. For recommended values of crystal circuit components, see Table 4-2.

4.2.2.2 OSC0 LVCMOS Digital Clock Source

Figure 4-10 shows the recommended oscillator connections when OSC0 is connected to an LVCMOS square-wave digital clock source. The LVCMOS clock source is connected to the XTALIN terminal. In this mode of operation, the XTALOUT terminal should not be used to source any external components. The printed circuit board design should provide a mechanism to disconnect the XTALOUT terminal from any external components or signal traces that may couple noise into OSC0 via the XTALOUT terminal.

The XTALIN terminal has a 15 - 40 k Ω internal pull-down resistor which is enabled when OSC0 is disabled. This internal resistor prevents the XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.

¹⁾ Initial accuracy, temperature drift, and aging effects should be combined when evaluating a reference clock for this requirement.

4.2.2.3 OSC1 Internal Oscillator Clock Source

Figure 4-11 shows the recommended crystal circuit for OSC1 of the ZCE package and Figure 4-12 shows the recommended crystal circuit for OSC1 of the ZCZ package. It is recommended that pre-production printed circuit board (PCB) designs include the two optional resistors R_{bias} and R_{d} in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases, R_{bias} is not required and R_{d} is a 0- Ω resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on pre-production PCBs.

The RTC_XTALIN terminal has a 10 - 40 k Ω internal pull-up resistor which is enabled when OSC1 is disabled. This internal resistor prevents the RTC_XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.

- MURAT IRXAN 2023.11 Oscillator components (Crystal, C1, C2, optional Rbias and Rd) must be located close to the AM335x package. Parasitic capacitance to the printed circuit board (PCB) ground and other signals should be minimized to reduce noise coupled into the oscillator.
 - C1 and C2 represent the total capacitance of the respective PCB trace, load capacitor, and other components (excluding the crystal) connected to each crystal terminal. The value of capacitors C1 and C2 should be selected to provide the total load capacitance, CL, specified by the crystal manufacturer. The total load capacitance is CL = $[(C_1^*C_2)/(C_1+C_2)] + C_{shunt}$, where C_{shunt} is the crystal shunt capacitance (C_0) specified by the crystal manufacturer plus any mutual capacitance $(C_{pkg} + C_{PCB})$ seen across the AM335x RTC_XTALIN and RTC_XTALOUT signals. For recommended values of crystal circuit components, see Table 4-5.

Figure 4-11. OSC1 (ZCE Package) Crystal Circuit Schematic

- Oscillator components (Crystal, C_1 , C_2 , optional R_{bias} and R_d) must be located close to the AM335x package. Parasitic capacitance to the printed circuit board (PCB) ground and other signals should be minimized to reduce noise coupled into the oscillator.

| t _{F(RTC_XTALIN)} | Time, LVCMOS reference clock fall | | 3 | 5 | ns |

(1) Initial accuracy, temperature drift, and aging effects should be combined when evaluating a reference clock for this requirement.

Power and Clocking

4.2.2.5 OSC1 Not Used

Figure 4-16 shows the recommended oscillator connections when OSC1 of the ZCE package is not used and Figure 4-17 shows the recommended oscillator connections when OSC1 of the ZCZ package is not used. An internal 10 k Ω pull-up on the RTC_XTALIN terminal is turned on when OSC1 is disabled to prevent this input from floating to an invalid logic level which may increase leakage current through the oscillator input buffer. OSC1 is disabled by default after power is applied. Therefore, both RTC_XTALIN and RTC_XTALOUT terminals should be a no connect (NC) when OSC1 is not used.

Figure 4-16, OSC1 (ZCE Package) Not Used Schematic

Figure 4-17. OSC1 (ZCZ Package) Not Used Schematic

4.2.3 Output Clock Specifications

The AM335x device has two clock output signals. The CLKOUT1 signal is always a replica of the OSC0 input clock which is referred to as the master oscillator (CLK_M_OSC) in the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73). The CLKOUT2 signal can be configured to output the OSC1 input clock, which is referred to as the 32K oscillator (CLK 32K RTC) in the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73), or four other internal clocks. For more information related to configuring these clock output signals, see the CLKOUT Signals section of the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).

Output Clock Characteristics

NOTE

The AM335x CLKOUT1 and CLKOUT2 clock outputs should not be used as a synchronous clock for any of the peripheral interfaces because they were not timing closed to any other signals. These clock outputs also were not designed to source any time critical external circuits that require a low jitter reference clock. The jitter performance of these outputs is unpredictable due to complex combinations of many system variables. For example, CLKOUT2 may be sourced from several PLLs with each PLL supporting many configurations that yield different jitter performance. There are also other unpredictable contributors to jitter performance such as application specific noise or crosstalk into the clock circuits. Therefore, there are no plans to specify jitter performance for these outputs.

4.2.4.1 CLKOUT1

The CLKOUT1 signal can be output on the XDMA EVENT INTR0 terminal. This terminal connects to one of seven internal signals via configurable multiplexers. The XDMA EVENT INTRO multiplexer must be configured for Mode 3 to connect the CLKOUT1 signal to the XDMA_EVENT_INTR0 terminal.

The default reset configuration of the XDMA_EVENT_INTRO multiplexer is selected by the logic level applied to the LCD DATA5 terminal on the rising edge of PWRONRSTn. The XDMA EVENT INTRO multiplexer is configured to Mode 7 if the LCD_DATA5 terminal is low on the rising edge of PWRONRSTn or Mode 3 if the LCD DATA5 terminal is high on the rising edge of PWRONRSTn. This allows the CLKOUT1 signal to be output on the XDMA_EVENT_INTR0 terminal without software intervention. In this mode, the output is held low while PWRONRSTn is active and begins to toggle after PWRONRSTn is released.

4.2.4.2 CLKOUT2

The CLKOUT2 signal can be output on the XDMA EVENT INTR1 terminal. This terminal connects to one of seven internal signals via configurable multiplexers. The XDMA_EVENT_INTR1 multiplexer must be configured for Mode 3 to connect the CLKOUT2 signal to the XDMA_EVENT_INTR1 terminal.

The default reset configuration of the XDMA_EVENT_INTR1 multiplexer is always Mode 7. Software must configure the XDMA_EVENT_INTR1 multiplexer to Mode 3 for the CLKOUT2 signal to be output on the XDMA_EVENT_INTR1 terminal.

5 Peripheral Information and Timings

The AM335x device contains many peripheral interfaces. In order to reduce package size and lower overall system cost while maintaining maximum functionality, many of the AM335x terminals can multiplex up to eight signal functions. Although there are many combinations of pin multiplexing that are possible, only a certain number of sets, called IO Sets, are valid due to timing limitations. These valid IO Sets were carefully chosen to provide many possible application scenarios for the user.

Texas Instruments has developed a Windows-based application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their AM335x-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pin-multiplexing configuration selected for a design only uses valid IO Sets supported by the AM335x device.

5.1 Parameter Information

The data provided in the following Timing Requirements and Switching Characteristics tables assumes the device is operating within the Recommended Operating Conditions defined in Section 3, unless otherwise noted.

5.1.1 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing or decreasing such delays. TI recommends utilizing the available IO buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

The timing parameter values specified in this data manual assume the SLEWCTRL bit in each pad control register is configured for fast mode (0b).

For the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface timings are met.

5.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals *must* transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

LAM 2023-1 AN 2352 MPU

5.5 Ethernet Media Access Controller (EMAC) and Switch

5.5.1 Ethernet MAC and Switch Electrical Data and Timing

The Ethernet MAC and Switch implemented in the AM335x device supports GMII mode, but the AM335x design does not pin out 9 of the 24 GMII signals. This was done to reduce the total number of package terminals. Therefore, the AM335x device does not support GMII mode. MII mode is supported with the remaining GMII signals.

The AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73) and this document may reference internal signal names when discussing peripheral input and output signals since many of the AM335x package terminals can be multiplexed to one of several peripheral signals. For example, the AM335x terminal names for port 1 of the Ethernet MAC and switch have been changed from GMII to MII to indicate their Mode 0 function, but the internal signal is named GMII. However, documents that describe the Ethernet switch reference these signals by their internal signal name. For a cross-reference of internal signal names to terminal names, see Table 2-7.

Operation of the Ethernet MAC and switch is not supported for OPP50.

Table 5-5. Ethernet MAC and Switch Timing Conditions

5.6 **External Memory Interfaces**

The device includes the following external memory interfaces:

- General-purpose memory controller (GPMC)
- mDDR(LPDDR), DDR2, DDR3, DDR3L Memory Interface (EMIF)

5.6.1 General-Purpose Memory Controller (GPMC)

NOTE

For more information, see the Memory Subsystem and General-Purpose Memory Controller section of the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).

The GPMC is the unified memory controller used to interface external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

5.6.1.1 GPMC and NOR Flash—Synchronous Mode

Table 5-21 and Table 5-22 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-17 through Figure 5-21).

5.6.1.2 GPMC and NOR Flash—Asynchronous Mode

Table 5-24 and Table 5-25 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 5-22 through Figure 5-27).

Table 5-23. GPMC and NOR Flash Timing Conditions—Asynchronous Mode

| D | TIMING CONDITION PARAMETER | (A) | MIN | TYP MAX | UNIT |
|-------------------|----------------------------|-----|-----|---------|------|
| Input Con | ditions | at, | | | |
| t_R | Input signal rise time | | 1 | 5 | ns |
| t _F | Input signal fall time | | 1 | 5 | ns |
| Output Condition | | | | | |
| C _{LOAD} | Output load capacitance | | 3 | 30 | pF |

Table 5-24. GPMC and NOR Flash Internal Timing Parameters—Asynchronous Mode⁽¹⁾⁽²⁾

| NO. | | OPP100 | OPP50 | UNIT |
|-----|--|---------|---------|------|
| NO. | | MIN MAX | MIN MAX | UNII |
| FI1 | Delay time, output data gpmc_ad[15:0] generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI2 | Delay time, input data gpmc_ad[15:0] capture from internal functional clock GPMC_FCLK ⁽³⁾ | 4 | 4 | ns |
| FI3 | Delay time, output chip select gpmc_csn[x] generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI4 | Delay time, output address gpmc_a[27:1] generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI5 | Delay time, output address gpmc_a[27:1] valid from internal functional clock GPMC_FCLK ³ | 6.5 | 6.5 | ns |
| FI6 | Delay time, output lower-byte enable and command latch enable gpmc_be0n_cle, output upper-byte enable gpmc_be1n generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI7 | Delay time, output enable gpmc_oen generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI8 | Delay time, output write enable gpmc_wen generation from internal functional clock GPMC_FCLK ⁽³⁾ | 6.5 | 6.5 | ns |
| FI9 | Skew, internal functional clock GPMC_FCLK ⁽³⁾ | 100 | 100 | ps |

⁽¹⁾ The internal parameters table must be used to calculate data access time stored in the corresponding CS register bit field.

⁽²⁾ Internal parameters are referred to the GPMC functional internal clock which is not provided externally.

⁽³⁾ GPMC_FCLK is general-purpose memory controller internal functional clock.

Table 5-25. GPMC and NOR Flash Timing Requirements—Asynchronous Mode

| NO. | | | OPP100 | OPP50 | UNIT |
|---------------------|-----------------------------|---------------------------------------|------------------|------------------|------|
| | ഹാ | | MIN MAX | MIN MAX | |
| FA5 ⁽¹⁾ | t _{acc(d)} | Data access time | H ⁽⁵⁾ | H ⁽⁵⁾ | ns |
| FA20 ⁽²⁾ | t _{acc1-pgmode(d)} | Page mode successive data access time | P ⁽⁴⁾ | P ⁽⁴⁾ | ns |
| FA21 ⁽³⁾ | t _{acc2-pgmode(d)} | Page mode first data access time | H ⁽⁵⁾ | H ⁽⁵⁾ | ns |

- (1) The FA5 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.
- The FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.
- (3) The FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data is internally sampled by active functional clock edge. FA21 value must be stored inside the AccessTime register bit field.
- (4) P = PageBurstAccessTime * (TimeParaGranularity + 1) * GPMC_FCLK(6)
- (5) H = AccessTime * (TimeParaGranularity + 1) * GPMC FCLK(6)
- (6) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

Figure 5-31, GPMC and NAND Flash—Data Write Cycle

5.6.2 mDDR(LPDDR), DDR2, DDR3, DDR3L Memory Interface

The device has a dedicated interface to mDDR(LPDDR), DDR2, DDR3, and DDR3L SDRAM. It supports JEDEC standard compliant mDDR(LPDDR), DDR2, DDR3, and DDR3L SDRAM devices with a 16-bit data path to external SDRAM memory.

For more details on the mDDR(LPDDR), DDR2, DDR3, and DDR3L memory interface, see the EMIF section of the AM335x Sitara ARM Cortex A-8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).

5.6.2.1 mDDR(LPDDR) Routing Guidelines

It is common to find industry references to mobile double data rate (mDDR) when discussing JEDEC defined low-power double-data rate (LPDDR) memory devices. The following guidelines use LPDDR when referencing JEDEC defined low-power double-data rate memory devices.

5.6.2.1.1 Board Designs

TI only supports board designs that follow the guidelines outlined in this document. The switching characteristics and the timing diagram for the LPDDR memory interface are shown in Table 5-31 and Figure 5-32.

Table 5-31. Switching Characteristics for LPDDR Memory Interface

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|---|-----|-----|------|
| 1 | $t_{c(DDR_CK)} \ t_{c(DDR_CKn)}$ Cycle time, DDR_CK and DDR_CKn | 215 | (1) | ns |

(1) The JEDEC JESD209B specification only defines the maximum clock period for LPDDR333 and faster speed bin LPDDR memory devices. To determine the maximum clock period, see the respective LPDDR memory data sheet.

Figure 5-32. LPDDR Memory Interface Clock Timing

5.6.2.1.2 LPDDR Interface

This section provides the timing specification for the LPDDR interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable LPDDR memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this LPDDR specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* application report (literature number SPRAAVO). This application report provides generic guidelines and approach. All the specifications provided in the data manual take precedence over the generic guidelines and must be adhered to for a reliable LPDDR interface operation.

5.6.2.1.2.1 LPDDR Interface Schematic

Figure 5-33 shows the schematic connections for 16-bit interface on AM335x device using one x16 LPDDR device. The AM335x LPDDR memory interface only supports 16-bit wide mode of operation. The AM335x° device can only source one load connected to the DQS[x] and DQ[x] net class signals and one load connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see Section 5.6.2.1.2.8.

www.ti.com

- Enable internal weak pulldown on these pins. For details, see the EMIF section of the AM335x Sitara ARM Cortex A-8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).
- For all the termination requirements, see Section 5.6.2.1.2.9.

Figure 5-33. 16-Bit LPDDR Interface Using One 16-Bit LPDDR Device

5.6.2.1.2.2 Compatible JEDEC LPDDR Devices

Table 5-32 shows the parameters of the JEDEC LPDDR devices that are compatible with this interface. Generally, the LPDDR interface is compatible with x16 LPDDR400 speed grade LPDDR devices.

Table 5-32. Compatible JEDEC LPDDR Devices (Per Interface)(1)

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|-----------------------------------|----------|-----|-----------|
| 21/ | JEDEC LPDDR device speed grade | LPDDR400 | | |
| 2 | JEDEC LPDDR device bit width | x16 | x16 | Bits |
| 3 | JEDEC LPDDR device count | | 1 | Devices |
| 4 | JEDEC LPDDR device terminal count | | 60 | Terminals |

⁽¹⁾ If the LPDDR interface is operated with a clock frequency less than 200 MHz, lower-speed grade LPDDR devices may be used if the minimum clock period specified for the LPDDR device is less than or equal to the minimum clock period selected for the AM335x LPDDR interface.

5.6.2.1.2.3 PCB Stackup

The minimum stackup required for routing the AM335x device is a four-layer stackup as shown in Table 5-33. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

Table 5-33. Minimum PCB Stackup(1)

| LAYER | TYPE | DESCRIPTION |
|-------|--------|-----------------------|
| 1 | Signal | Top signal routing |
| 2 | Plane | Ground |
| 3 | Plane | Split Power Plane |
| 4 | Signal | Bottom signal routing |

⁽¹⁾ All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in

www.ti.com

Complete stackup specifications are provided in Table 5-34.

Table 5-34. PCB Stackup Specifications (1)

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT | |
|-----|---|-------------------|------|-----|------|------|--|

- (3) Measurements from center of AM335x device to center of LPDDR device.
- (4) For single-memory systems, it is recommended that Y offset be as small as possible.
- (5) w is defined as the signal trace width.
- (6) Non-LPDDR signals allowed within LPDDR keepout region provided they are separated from LPDDR routing layers by a ground plane.

JAN 2023-11 AN 3352 MPU

LPDDR Keepout Region 5.6.2.1.2.5

The region of the PCB used for the LPDDR circuitry must be isolated from other signals. The LPDDR keepout region is defined for this purpose and is shown in Figure 5-35. This region should encompass all LPDDR circuitry and the region size varies with component placement and LPDDR routing. Additional clearances required for the keepout region are shown in Table 5-35. Non-LPDDR signals should not be routed on the same signal layer as LPDDR signals within the LPDDR keepout region. Non-LPDDR signals may be routed in the region provided they are routed on layers separated from LPDDR signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

Figure 5-35. LPDDR Keepout Region

5.6.2.1.2.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the LPDDR and other circuitry. Table 5-36 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM335x LPDDR interface and LPDDR devices. Additional bulk bypass capacitance may be needed for other circuitry.

| Table 5-36. Bu | ulk Rynaes | Canacitors (1) |
|-----------------|------------|----------------|
| I able 5-30. Di | uik Dybass | Cavacitors |

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|--|-----|-----|---------|
| 1 | AM335x VDDS_DDR bulk bypass capacitor count | 1 | | Devices |
| 2 | AM335x VDDS_DDR bulk bypass total capacitance | 10 | | μF |
| 3 | LPDDR#1 bulk bypass capacitor count | 1 | | Devices |

| 5 | LPDDR#2 bulk bypass capacitor count ⁽²⁾ | 1 | | Devices |
| 6 | LPDDR#2 bulk bypass total capacitance ⁽²⁾ | 10 | | μF |

⁽¹⁾ These devices should be placed near the device they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors.

ART 2023-1 ANS 352 (2) Only used when two LPDDR devices are used.

5.6.2.1.2.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper LPDDR interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, AM335x device LPDDR power, and AM335x device LPDDR ground connections. Table 5-37 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB.

Table 5-37. High-Speed Bypass Capacitors

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|--|-----|------|---------|
| 1 | HS bypass capacitor package size ⁽¹⁾ | (| 0402 | 10 mils |
| 2 | Distance from HS bypass capacitor to device being bypassed | | 250 | mils |
| 3 | Number of connection vias for each HS bypass capacitor ⁽²⁾ | 2 | | Vias |
| 4 | Trace length from bypass capacitor contact to connection via | | 30 | mils |
| 5 | Number of connection vias for each AM335x VDDS_DDR and VSS terminal | 1 | | Vias |
| 6 | Trace length from AM335x VDDS_DDR and VSS terminal to connection via | | 35 | mils |

⁽¹⁾ LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.

5.6.2.1.2.8 Net Classes

Table 5-38 lists the clock net classes for the LPDDR interface. Table 5-39 lists the signal net classes, and associated clock net classes, for the signals in the LPDDR interface. These net classes are used for the termination and routing rules that follow.

Table 5-38. Clock Net Class Definitions

| CLOCK NET CLASS | AM335x PIN NAMES |
|-----------------|--------------------|
| CK | DDR_CK and DDR_CKn |
| DQS0 | DDR_DQS0 |
| DQS1 | DDR_DQS1 |

Table 5-39. Signal Net Class Definitions

| SIGNAL NET CLASS | ASSOCIATED CLOCK NET CLASS | AM335x PIN NAMES |
|------------------|-------------------------------|--|
| ADDR_CTRL | СК | DDR_BA[1:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE |
| DQ0 | DQS0 | DDR_D[7:0], DDR_DQM0 |
| DQ1 | DQS1 | DDR_D[15:8], DDR_DQM1 |

Peripheral Information and Timings

⁽²⁾ An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.

⁽³⁾ These devices should be placed as close as possible to the device being bypassed.

⁽⁴⁾ Per LPDDR device.

www.ti.com

5.6.2.1.2.9 LPDDR Signal Termination

There is no specific need for adding terminations on the LPDDR interface. However, system designers may evaluate the need for serial terminators for EMI and overshoot reduction. Placement of serial terminations for DQS[x] and DQ[x] net class signals should be determined based on PCB analysis. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM335x device. Table 5-40 shows the specifications for the serial terminators in such cases.

Table 5-40. LPDDR Signal Terminations

| No. | Parameter | Min | Тур | Max | Unit |
|-----|--|-----|-----|-------------------|------|
| 1 | CK net class ⁽¹⁾ | 0 | 22 | Zo ⁽²⁾ | ohms |
| 2 | ADDR_CTRL net class ⁽¹⁾⁽³⁾⁽⁴⁾ | 0 | 22 | Zo ⁽²⁾ | ohms |
| 3 | DQS0, DQS1, DQ0, and DQ1 net classes | 0 | 22 | Zo ⁽²⁾ | ohms |

⁽¹⁾ Only series termination is permitted.

⁽²⁾ Zo is the LPDDR PCB trace characteristic impedance.

MURATIRKAN 2023-11 ANI 3352 MPU (3) Series termination values larger than typical only recommended to address EMI issues.

unifor unifor AND STATE PROPERTY AND STATE OF THE PROPERTY AND STATE O (4) Series termination values should be uniform across net class.

5.6.2.1.3 LPDDR CK and ADDR CTRL Routing

Figure 5-36 shows the topology of the routing for the CK and ADDR_CTRL net classes. The length of signal path AB and AC should be minimized with emphasis to minimize lengths C and D such that length A is the majority of the total length of signal path AB and AC.

Figure 5-36. CK and ADDR_CTRL Routing and Topology

Table 5-41. CK and ADDR_CTRL Routing Specification(1)(2)

| | 6/ | | | | | |
|-----|--|----|----------|----------|----------|------|
| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
| 1 | Center-to-center CK spacing | | | 6 | 2w | |
| 2 | CK differential pair skew length mismatch ⁽²⁾⁽³⁾ | | | M | 25 | mils |
| 3 | CK B-to-CK C skew length mismatch | | N | K | 25 | mils |
| 4 | Center-to-center CK to other LPDDR trace spacing ⁽⁴⁾ | | 4w | | | |
| 5 | CK and ADDR_CTRL nominal trace length ⁽⁵⁾ | | CACLM-50 | CACLM | CACLM+50 | mils |
| 6 | ADDR_CTRL-to-CK skew length mismatch | | 201 | | 100 | mils |
| 7 | ADDR_CTRL-to-ADDR_CTRL skew length mismatch | | | | 100 | mils |
| 8 | Center-to-center ADDR_CTRL to other LPDDR trace spacing ⁽⁴⁾ | | 4w | | | |
| 9 | Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing ⁽⁴⁾ | | 3w | | | |
| 10 | ADDR_CTRL A-to-B and ADDR_CTRL A-to-C skew length mismatch ⁽²⁾ | 16 | | | 100 | mils |
| 11 | ADDR_CTRL B-to-C skew length mismatch | 1 | | | 100 | mils |

- (1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.
- (2) Series terminator, if used, should be located closest to the AM335x device.
- (3) Differential impedance should be Zo x 2, where Zo is the single-ended impedance defined in Table 5-34.
- Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- NIPAT 15° (5) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

Figure 5-37 shows the topology and routing for the DQS[x] and DQ[x] net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

Figure 5-37. DQS[x] and DQ[x] Routing and Topology

Table 5-42. DQS[x] and DQ[x] Routing Specification(1)

| NO. | PARAMETER | MIN | TYP | MAX | UNIT |
|-----|---|---------|----------|---------|------|
| 1 | Center-to-center DQS[x] spacing | | | 2w | |
| 2 | Center-to-center DDR_DQS[x] to other LPDDR trace spacing ⁽²⁾ | 4w | | | |
| 3 | DQS[x] and DQ[x] nominal trace length (3) | DQLM-50 | DQLM | DQLM+50 | mils |
| 4 | DQ[x]-to-DQS[x] skew length mismatch ⁽³⁾ | | | 100 | mils |
| 5 | DQ[x]-to-DQ[x] skew length mismatch ⁽³⁾ | | 6 | 100 | mils |
| 6 | Center-to-center DQ[x] to other LPDDR trace spacing ⁽²⁾⁽⁴⁾ | 4w | <u> </u> | , | |
| 7 | Center-to-center DQ[x] to other DQ[x] trace spacing ⁽²⁾⁽⁵⁾ | 3w | "Vis | | |

- (1) DQS[x] represents the DQS0 and DQS1 clock net classes, and DQ[x] represents the DQ0 and DQ1 signal net classes.
- (2) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (3) There is no requirement for skew matching between data bytes; that is, from net classes DQS0 and DQ0 to net classes DQS1 and DQ1.
- (4) Signals from one DQ net class should be considered other LPDDR traces to another DQ net class.
- (5) DQLM is the longest Manhattan distance of each of the DQS[x] and DQ[x] net classes.

5.6.2.2 DDR2 Routing Guidelines

5.6.2.2.1 Board Designs

TI only supports board designs that follow the guidelines outlined in this document. The switching characteristics and the timing diagram for the DDR2 memory interface are shown in Table 5-43 and Figure 5-38.

Table 5-43. Switching Characteristics for DDR2 Memory Interface

| NO. | | PARAMETER | | MIN | MAX | UNIT |
|-----|--|--------------------------------|-----|------|------------------|------|
| 1 | $\begin{array}{c} t_{c(DDR_CK)} \\ t_{c(DDR_CKn)} \end{array}$ | Cycle time, DDR_CK and DDR_CKn | JP. | 3.75 | 8 ⁽¹⁾ | ns |

(1) The JEDEC JESD79-2F specification defines the maximum clock period of 8 ns for all standard-speed bin DDR2 memory devices. Therefore, all standard-speed bin DDR2 memory devices are required to operate at 125 MHz.

Figure 5-38. DDR2 Memory Interface Clock Timing

5.6.2.2.2 DDR2 Interface

This section provides the timing specification for the DDR2 interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable DDR2 memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this DDR2 specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* application report (literature number SPRAAVO). This application report provides generic guidelines and approach. All the specifications provided in the data manual take precedence over the generic guidelines and must be adhered to for a reliable DDR2 interface operation.

5.6.2.2.2.1 DDR2 Interface Schematic

Figure 5-39 shows the schematic connections for 16-bit interface on AM335x device using one x16 DDR2 device and Figure 5-40 shows the schematic connections for 16-bit interface on AM335x using two x8 DDR2 devices. The AM335x DDR2 memory interface only supports 16-bit wide mode of operation. The AM335x device can only source one load connected to the DQS[x] and DQ[x] net class signals and two loads connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see Section 5.6.2.2.2.8.

www.ti.com

- VDDS DDR is the power supply for the DDR2 memories and the AM335x DDR2 interface.
- One of these capacitors can be eliminated if the divider and its capacitors are placed near a DDR_VREF pin.
- For all the termination requirements, see Section 5.6.2.2.2.9.

Figure 5-39. 16-Bit DDR2 Interface Using One 16-Bit DDR2 Device

- VDDS_DDR is the power supply for the DDR2 memories and the AM335x DDR2 interface.
- One of these capacitors can be eliminated if the divider and its capacitors are placed near a DDR_VREF pin.
- For all the termination requirements, see Section 5.6.2.2.2.9.

Figure 5-40. 16-Bit DDR2 Interface Using Two 8-Bit DDR2 Devices

Compatible JEDEC DDR2 Devices 5.6.2.2.2.2

Table 5-44 shows the parameters of the JEDEC DDR2 devices that are compatible with this interface. Generally, the DDR2 interface is compatible with x16 or x8 DDR2-533 speed grade DDR2 devices.

Table 5-44. Compatible JEDEC DDR2 Devices (Per Interface)(1)

| NO. | PARAMETER | MIN | MAX | UNIT |
|-----|---|----------|-----|-----------|
| 1 | JEDEC DDR2 device speed grade ⁽²⁾ | DDR2-533 | | |
| 2 | JEDEC DDR2 device bit width | x8 | x16 | Bits |
| 3 | JEDEC DDR2 device count | 1 | 2 | Devices |
| 4 | JEDEC DDR2 device terminal count ⁽³⁾ | 60 | 84 | Terminals |

⁽¹⁾ If the DDR2 interface is operated with a clock frequency less than 266 MHz, lower-speed grade DDR2 devices may be used if the minimum clock period specified for the DDR2 device is less than or equal to the minimum clock period selected for the AM335x DDR2

5.6.2.2.2.3 PCB Stackup

The minimum stackup required for routing the AM335x device is a four-layer stackup as shown in Table 5-45. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

Table 5-45. Minimum PCB Stackup(1)

| LAYER | TYPE | DESCRIPTION |
|-------|--------|-----------------------|
| 1 | Signal | Top signal routing |
| 2 | Plane | Ground |
| 3 | Plane | Split Power Plane |
| 4 | Signal | Bottom signal routing |

All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in the power plane.

AN 2023-11 AN 3352 MPU

⁽²⁾ Higher DDR2 speed grades are supported due to inherent JEDEC DDR2 backwards compatibility.

^{(3) 92-}terminal devices are also supported for legacy reasons. New designs will migrate to 84-terminal DDR2 devices. Electrically, the 92and 84-terminal DDR2 devices are the same.

Complete stackup specifications are provided in Table 5-46.

Table 5-46. PCB Stackup Specifications (1)

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-----|--|-----------------------|------|-----|------|--------|
| 1 | PCB routing and plane layers | | 4 | | | |
| 2 | Signal routing layers | Signal routing layers | | | | |

| 6 | Number of layers between DDR2 routing layer and reference ground plane | | | | 0 | |
| 7 | PCB routing feature size | | | 4 | | mils |
| 8 | PCB trace width, w | | | 4 | | mils |
| 9 | PCB BGA escape via pad size ⁽²⁾ | | | 18 | 20 | mils |
| 10 | PCB BGA escape via hole size ⁽²⁾ | | | 10 | | mils |
| 11 | AM335x BGA pad size | ZCZ package | | 0.5 | | mm |
| 11 | ZCE package | | | 0.4 | | 111111 |
| 13 | Single-ended impedance, Zo ⁽³⁾ | | 50 | | 75 | ohms |
| 14 | Impedance control ⁽⁴⁾⁽⁵⁾ | · | Zo-5 | Zo | Zo+5 | ohms |

- (1) For the DDR2 device BGA pad size, see the DDR2 device manufacturer documentation.
- (2) A 20-10 via may be used if enough power routing resources are available. An 18-10 via allows for more flexible power routing to the AM335x device.
- (3) Zo is the nominal singled-ended impedance selected for the PCB.
- MIRATIRKAN 2023 (4) This parameter specifies the AC characteristic impedance tolerance for each segment of a PCB signal trace relative to the chosen Zo defined by the single-ended impedance parameter.
- (5) Tighter impedance control is required to ensure flight time skew is minimal.

MIRATION AND SERVICE OF THE SERVICE

5.6.2.2.2.4 Placement

Figure 5-41 shows the required placement for the DDR2 devices. The dimensions for this figure are defined in Table 5-47. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For single-memory DDR2 systems, the second DDR2 device is omitted from the placement.

Figure 5-41. AM335x Device and DDR2 Device Placement

Table 5-47. Placement Specifications⁽¹⁾

| NO. | PARAMETER | MIN W | ΑX | UNIT |
|-----|---|-------|-------------|------|
| 1 | X ⁽²⁾⁽³⁾ | 1 | 7 50 | mils |
| 2 | Y ⁽²⁾⁽³⁾ | 1: | 280 | mils |
| 3 | Y Offset ⁽²⁾⁽³⁾⁽⁴⁾ | | 350 | mils |
| 4 | Clearance from non-DDR2 signal to DDR2 keepout region ⁽⁵⁾⁽⁶⁾ | 4 | | w |

- (1) DDR2 keepout region to encompass entire DDR2 routing area.
- (2) For dimension definitions, see Figure 5-41.
- (3) Measurements from center of AM335x device to center of DDR2 device.
- (4) For single-memory systems, it is recommended that Y offset be as small as possible.
- (5) w is defined as the signal trace width.
- (6) Non-DDR2 signals allowed within DDR2 keepout region provided they are separated from DDR2 routing layers by a ground plane.

5.6.2.2.2.5 DDR2 Keepout Region

The region of the PCB used for the DDR2 circuitry must be isolated from other signals. The DDR2 keepout region is defined for this purpose and is shown in Figure 5-42. This region should encompass all DDR2 circuitry and the region size varies with component placement and DDR2 routing. Additional clearances required for the keepout region are shown in Table 5-47. Non-DDR2 signals should not be routed on the same signal layer as DDR2 signals within the DDR2 keepout region. Non-DDR2 signals may be routed in the region provided they are routed on layers separated from DDR2 signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

Figure 5-42. DDR2 Keepout Region

5.6.2.2.2.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR2 and other circuitry. Table 5-48 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM335x DDR2 interface and DDR2 devices. Additional bulk bypass capacitance may be needed for other circuitry.

| | | |

⁽¹⁾ LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.

5.6.2.2.2.8 Net Classes

Table 5-50 lists the clock net classes for the DDR2 interface. Table 5-51 lists the signal net classes, and associated clock net classes, for the signals in the DDR2 interface. These net classes are used for the termination and routing rules that follow.

Table 5-50. Clock Net Class Definitions

| CLOCK NET CLASS | AM335x PIN NAMES | |
|-----------------|------------------------|--|
| CK | DDR_CK and DDR_CKn | |
| DQS0 | DDR_DQS0 and DDR_DQSn0 | |
| DQS1 | DDR_DQS1 and DDR_DQSn1 | |

Table 5-51. Signal Net Class Definitions

| SIGNAL NET CLASS | ASSOCIATED CLOCK NET CLASS | AM335x PIN NAMES |
|------------------|-------------------------------|---|
| ADDR_CTRL | СК | DDR_BA[2:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE, DDR_ODT |
| DQ0 | DQS0 | DDR_D[7:0], DDR_DQM0 |
| DQ1 | DQS1 | DDR_D[15:8], DDR_DQM1 |

⁽²⁾ An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.

⁽³⁾ These devices should be placed as close as possible to the device being bypassed.

⁽⁴⁾ Per DDR2 device.

5.6.2.2.2.9 DDR2 Signal Termination

Signal terminations are required on the CK and ADDR_CTRL net class signals. Serial terminations should be used on the CK and ADDR_CTRL lines and is the preferred termination scheme. On-device terminations (ODTs) are required on the DQS[x] and DQ[x] net class signals. They should be enabled to ensure signal integrity. Table 5-52 shows the specifications for the series terminators. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM335x device.

Table 5-52. DDR2 Signal Terminations

| NO. | PARAMETER | , R | MIN | TYP | MAX | UNIT |
|-----|---|-----|-----|-----|-------------------|------|
| 1 | CK net class ⁽¹⁾ | W) | 0 | | 10 | ohms |

- (1) Only series termination is permitted.
- (2) Series termination values larger than typical only recommended to address EMI issues.
- (3) Series termination values should be uniform across net class.
- (4) Zo is the DDR2 PCB trace characteristic impedance.
- (5) No external termination resistors are allowed and ODT must be used for these net classes.

If the DDR2 interface is operated at a lower frequency (<200-MHz clock rate), on-device terminations are not specifically required for the DQS[x] and DQ[x] net class signals and serial terminations for the CK and ADDR_CTRL net class signals are not mandatory. System designers may evaluate the need for serial terminators for EMI and overshoot reduction. Placement of serial terminations for DQS[x] and DQ[x] net class signals should be determined based on PCB analysis. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM335x device. Table 5-53 shows the specifications for the serial terminators in such cases.

Table 5-53. Lower-Frequency DDR2 Signal Terminations

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-----|--|---|-----|-----|-------------------|------|
| 1 | CK net class ⁽¹⁾ | 2 | 0 | 22 | Zo ⁽²⁾ | ohms |
| 2 | ADDR_CTRL net class ⁽¹⁾⁽³⁾⁽⁴⁾ | 7 | 0 | 22 | Zo ⁽²⁾ | ohms |
| 3 | DQS0, DQS1, DQ0, and DQ1 net classes | | 0 | 22 | Zo ⁽²⁾ | ohms |

- (1) Only series termination is permitted.
- (2) Zo is the DDR2 PCB trace characteristic impedance.
- (3) Series termination values larger than typical only recommended to address EMI issues.
- JP. Junifor
 JP. Ju (4) Series termination values should be uniform across net class.

5.6.2.2.2.10 DDR VREF Routing

DDR_VREF is used as a reference by the input buffers of the DDR2 memories as well as the AM335x device. DDR_VREF is intended to be half the DDR2 power supply voltage and should be created using a resistive divider as shown in Figure 5-39 and Figure 5-40. Other methods of creating DDR_VREF are not recommended. Figure 5-43 shows the layout guidelines for DDR_VREF.

Figure 5-43. DDR VREF Routing and Topology

5.6.2.2.3 DDR2 CK and ADDR_CTRL Routing

Figure 5-44 shows the topology of the routing for the CK and ADDR_CTRL net classes. The length of signal path AB and AC should be minimized with emphasis to minimize lengths C and D such that length A is the majority of the total length of signal path AB and AC.

Figure 5-44. CK and ADDR_CTRL Routing and Topology

Table 5-54. CK and ADDR_CTRL Routing Specification⁽¹⁾⁽²⁾

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-----|--|----|----------|---------------------------------------|----------|------|
| 1 | Center-to-center CK spacing | | | 3 | 2w | |
| 2 | CK differential pair skew length mismatch ⁽²⁾⁽³⁾ | | | M | 25 | mils |
| 3 | CK B-to-CK C skew length mismatch | | | \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ | 25 | mils |
| 4 | Center-to-center CK to other DDR2 trace spacing ⁽⁴⁾ | | 4w | | | |
| 5 | CK and ADDR_CTRL nominal trace length ⁽⁵⁾ | | CACLM-50 | CACLM | CACLM+50 | mils |
| 6 | ADDR_CTRL-to-CK skew length mismatch | | 001 | | 100 | mils |
| 7 | ADDR_CTRL-to-ADDR_CTRL skew length mismatch | | | | 100 | mils |
| 8 | Center-to-center ADDR_CTRL to other DDR2 trace spacing ⁽⁴⁾ | | 4w | | | |
| 9 | Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing ⁽⁴⁾ | | 3w | | | |
| 10 | ADDR_CTRL A-to-B and ADDR_CTRL A-to-C skew length mismatch ⁽²⁾ | 16 | | | 100 | mils |
| 11 | ADDR_CTRL B-to-C skew length mismatch | 1 | | | 100 | mils |

- (1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.
- (2) Series terminator, if used, should be located closest to the AM335x device.
- (3) Differential impedance should be Zo x 2, where Zo is the single-ended impedance defined in Table 5-46.
- (4) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (5) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

Figure 5-45 shows the topology and routing for the DQS[x] and DQ[x] net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

Figure 5-45. DQS[x] and DQ[x] Routing and Topology

Table 5-55. DQS[x] and DQ[x] Routing Specification(1)

5.6.2.3 DDR3 and DDR3L Routing Guidelines

NOTE

All references to DDR3 in this section apply to DDR3 and DDR3L devices, unless otherwise noted.

5.6.2.3.1 Board Designs

TI only supports board designs utilizing DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory interface are shown in Table 5-56 and Figure 5-46.

Table 5-56. Switching Characteristics for DDR3 Memory Interface

| NO. | | PARAMETER | | MAX | UNIT |
|-----|---------------------------------------|--------------------------------|-----|--------------------|------|
| 1 | $t_{c(DDR_CK)}$ $t_{c(DDR_CKn)}$ | Cycle time, DDR_CK and DDR_CKn | 2.5 | 3.3 ⁽¹⁾ | ns |

(1) The JEDEC JESD79-3F Standard defines the maximum clock period of 3.3 ns for all standard-speed bin DDR3 and DDR3L memory devices. Therefore, all standard-speed bin DDR3 and DDR3L memory devices are required to operate at 303 MHz.

Figure 5-46. DDR3 Memory Interface Clock Timing

5.6.2.3.1.1 DDR3 versus DDR2

This specification only covers AM335x PCB designs that utilize DDR3 memory. Designs using DDR2 memory should use the DDR2 routing guidleines described in Section 5.6.2.2. While similar, the two memory systems have different requirements. It is currently not possible to design one PCB that meets the requirements of both DDR2 and DDR3.

5.6.2.3.2 DDR3 Device Combinations

Since there are several possible combinations of device counts and single-side or dual-side mounting, Table 5-57 summarizes the supported device configurations.

Table 5-57. Supported DDR3 Device Combinations

| NUMBER OF DDR3 DEVICES | DDR3 DEVICE WIDTH (BITS) | MIRRORED? | DDR3 EMIF WIDTH (BITS) |
|------------------------|--------------------------|------------------|------------------------|
| 1 | 16 | N | 16 |
| 2 | 8 | Y ⁽¹⁾ | 16 |

(1) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.

Peripheral Information and Timings

5.6.2.3.3 DDR3 Interface

5.6.2.3.3.1 DDR3 Interface Schematic

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used. Figure 5-47 shows the schematic connections for 16-bit interface on AM335x device using one x16 DDR3 device and Figure 5-49 shows the schematic connections for 16-bit interface on AM335x device using two x8 DDR3 devices. The AM335x DDR3 memory interface only supports 16-bit wide mode of operation. The AM335x device can only source one load connected to the DQS[x] and DQ[x] net class signals and two loads connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see Section 5.6.2.3.3.8.

Figure 5-47. 16-Bit DDR3 Interface Using One 16-Bit DDR3 Device with V_{TT} Termination

VDDS DDR is the power supply for the DDR3 memories and the AM335x DDR3 interface.

Figure 5-48. 16-Bit DDR3 Interface Using One 16-Bit DDR3 Device without V_{TT} Termination

www.ti.com

Figure 5-49. 16-Bit DDR3 Interface Using Two 8-Bit DDR3 Devices

5.6.2.3.3.2 Compatible JEDEC DDR3 Devices

Table 5-58 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface.

Table 5-58. Compatible JEDEC DDR3 Devices (Per Interface)

| NO. | PARAMETER | CONDITION | MIN | MAX | UNIT |
|------|--|---|-----------|-----|---------|
| O.K. | | $t_{C(DDR_CK)}$ and $t_{C(DDR_CKn)} = 3.3$ ns | DDR3-800 | | |
| | JEDEC DDR3 device speed grade | $t_{C(DDR_CK)}$ and $t_{C(DDR_CKn)} = 2.5$ ns | DDR3-1600 | | |
| 2 | JEDEC DDR3 device bit width | <u> </u> | x8 | x16 | Bits |
| 3 | JEDEC DDR3 device count ⁽¹⁾ | | 1 | 2 | Devices |

⁽¹⁾ For valid DDR3 device configurations and device counts, see Section 5.6.2.3.3.1, Figure 5-47, and Figure 5-49.

5.6.2.3.3.3 PCB Stackup

The minimum stackup for routing the DDR3 interface is a four-layer stack up as shown in Table 5-59. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

Table 5-59. Minimum PCB Stackup(1)

| 0.7 | | |
|-------|--------|-----------------------|
| LAYER | TYPE | DESCRIPTION |
| 1 | Signal | Top signal routing |
| 2 | Plane | Ground |
| 3 | Plane | Split Power Plane |
| 4 | Signal | Bottom signal routing |

(1) All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in

Table 5-60. PCB Stackup Specifications⁽¹⁾

| NO. | PARAMETER | | MIN | TYP | MAX | UNIT |
|-----|---|---------------------|----------|-----|------|------|
| 1 | PCB routing and plane layers | 45 | | | | |
| 2 | Signal routing layers | | 2 | | | |
| 3 | Full ground reference layers under DDR3 routing reg | jion ⁽²⁾ | 1 | | | |
| 4 | Full VDDS_DDR power reference layers under the D | 1 | | | | |
| 5 | Number of reference plane cuts allowed within DDR3 | | | 0 | | |
| 6 | Number of layers between DDR3 routing layer and re | | | 0 | | |
| 7 | PCB routing feature size | | 4 | | mils | |
| 8 | PCB trace width, w | | | 4 | | mils |
| 9 | PCB BGA escape via pad size ⁽⁵⁾ | | | 18 | 20 | mils |
| 10 | PCB BGA escape via hole size | | | 10 | | mils |
| 11 | AM225x PCA pod size | ZCZ package | | 0.5 | | mm |
| '' | AM335x BGA pad size | ZCE package | | 0.4 | | mm |
| 13 | Single-ended impedance, Zo ⁽⁶⁾ | 50 | | 75 | ohms | |
| 14 | Impedance control ⁽⁷⁾⁽⁸⁾ | | Zo-5 | Zo | Zo+5 | ohms |

- (1) For the DDR3 device BGA pad size, see the DDR3 device manufacturer documentation.
- (2) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
- (3) No traces should cross reference plane cuts within the DDR3 routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
- (4) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
- (5) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.
- (6) Zo is the nominal singled-ended impedance selected for the PCB.
- (7) This parameter specifies the AC characteristic impedance tolerance for each segment of a PCB signal trace relative to the chosen Zo MURATIRKAN defined by the single-ended impedance parameter.
- (8) Tighter impedance control is required to ensure flight time skew is minimal.

5.6.2.3.3.4 Placement

Figure 5-50 shows the required placement for the AM335x device as well as the DDR3 devices. The dimensions for this figure are defined in Table 5-61. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space.

Figure 5-50. Placement Specifications

Table 5-61. Placement Specifications (1)

| NO. | PARAMETER | MIN MAX | UNIT |
|-----|---|---------|------|
| 1 | X1 ⁽²⁾⁽³⁾⁽⁴⁾ | 1000 | mils |
| 2 | X2 ⁽²⁾⁽³⁾ | 600 | mils |
| 3 | Y Offset ⁽²⁾⁽³⁾⁽⁴⁾ | 1500 | mils |
| 4 | Clearance from non-DDR3 signal to DDR3 keepout region ⁽⁵⁾⁽⁶⁾ | 4 | w |

- (1) DDR3 keepout region to encompass entire DDR3 routing area.
- (2) For dimension definitions, see Figure 5-50.
- (3) Measurements from center of AM335x device to center of DDR3 device.
- (4) Minimizing X1 and Y improves timing margins.
- (5) w is defined as the signal trace width.
- (6) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.

AN 2023-1 AN 3352 MPU

5.6.2.3.3.5 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in Figure 5-51. This region should encompass all DDR3 circuitry and the region size varies with component placement and DDR3 routing. Additional clearances required for the keepout region are shown in Table 5-61. Non-DDR3 signals should not be routed on the same signal layer as DDR3 signals within the DDR3 keepout region. Non-DDR3 signals may be routed in the region provided they are routed on layers separated from DDR3 signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

Figure 5-51. DDR3 Keepout Region

5.6.2.3.3.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. Table 5-62 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM335x DDR3 interface and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

| Table 5-62. | Bulk | Bypass | Capacitors ⁽¹⁾ |
|-------------|------|---------------|---------------------------|
|-------------|------|---------------|---------------------------|

| NO. | PARAMETER | MIN M | IAX UNIT |
|-----|---|-------|----------|
| 1 | AM335x VDDS_DDR bulk bypass capacitor count | 2 | Devices |
| 2 | AM335x VDDS_DDR bulk bypass total capacitance | 20 | μF |
| 3 | DDR3#1 bulk bypass capacitor count | 2 | Devices |
| 4 | DDR3#1 bulk bypass total capacitance | 20 | μF |
| 5 | DDR3#2 bulk bypass capacitor count ⁽²⁾ | 2 | Devices |
| 6 | DDR3#2 bulk bypass total capacitance ⁽²⁾ | 20 | μF |

⁽¹⁾ These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

(2) Only used when two DDR3 devices are used.

5.6.2.3.3.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, AM335x device DDR3 power, and AM335x device DDR3 ground connections. Table 5-63 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

- Fit as many HS bypass capacitors as possible.
- 2. Minimize the distance from the bypass cap to the power terminals being bypassed.
- 3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
- 4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
- 5. Minimize via sharing. Note the limites on via sharing shown in Table 5-63.

Table 5-63. High-Speed Bypass Capacitors

| NO. | PARAMETER | MIN | TYP MA | X UNIT |
|-----|---|------|----------|---------|
| 1 | HS bypass capacitor package size ⁽¹⁾ | | 0201 040 | 10 mils |
| 2 | Distance, HS bypass capacitor to AM335x VDDS_DDR and VSS terminal being bypassed $^{(2)(3)(4)}$ | | 4(| 00 mils |
| 3 | AM335x VDDS_DDR HS bypass capacitor count | 20 | N. | Devices |
| 4 | AM335x VDDS_DDR HS bypass capacitor total capacitance | 1 | 501 | μF |
| 5 | Trace length from AM335x VDDS_DDR and VSS terminal to connection via (2) | | 35.5 | 0 mils |
| 6 | Distance, HS bypass capacitor to DDR3 device being bypassed ⁽⁵⁾ | | 215 | 0 mils |
| 7 | DDR3 device HS bypass capacitor count ⁽⁶⁾ | 12 | , \ ' | Devices |
| 8 | DDR3 device HS bypass capacitor total capacitance ⁽⁶⁾ | 0.85 | | μF |
| 9 | Number of connection vias for each HS bypass capacitor ⁽⁷⁾⁽⁸⁾ | 2 | | Vias |
| 10 | Trace length from bypass capacitor connect to connection via ⁽²⁾⁽⁸⁾ | | 35 10 | 00 mils |
| 11 | Number of connection vias for each DDR3 device power and ground terminal (9) | PL 1 | | Vias |
| 12 | Trace length from DDR3 device power and ground terminal to connection via (2)(7) | | 35 | 60 mils |

- (1) LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.
- (2) Closer and shorter is better.
- (3) Measured from the nearest AM335x VDDS_DDR and ground terminal to the center of the capacitor package.
- (4) Three of these capacitors should be located underneath the AM335x device, between the cluster of VDDS_DDR and ground terminals, between the DDR3 interfaces on the package.
- (5) Measured from the DDR3 device power and ground terminal to the center of the capacitor package.
- (6) Per DDR3 device.
- (7) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.
- (8) An HS bypass capacitor may share a via with a DDR3 device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR3 device pad should be less than 150 mils.
- (9) Up to a total of two pairs of DDR3 power and ground terminals may share a via.

5.6.2.3.3.7.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Since these are returns for signal current, the signal via size may be used for these capacitors.

Peripheral Information and Timings

5.6.2.3.3.8 Net Classes

Table 5-64 lists the clock net classes for the DDR3 interface. Table 5-65 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

Table 5-64. Clock Net Class Definitions

| CLOCK NET CLASS | AM335x PIN NAMES | | | |
|------------------------|------------------------|--|--|--|
| CK | DDR_CK and DDR_CKn | | | |
| DQS0 | DDR_DQS0 and DDR_DQSn0 | | | |
| DQS1 | DDR_DQS1 and DDR_DQSn1 | | | |

Table 5-65. Signal Net Class Definitions

| SIGNAL NET CLASS | ASSOCIATED CLOCK NET CLASS | AM335x PIN NAMES |
|------------------|-------------------------------|---|
| ADDR_CTRL | CK | DDR_BA[2:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE, DDR_ODT |
| DQ0 | DQS0 | DDR_D[7:0], DDR_DQM0 |
| DQ1 | DQS1 | DDR_D[15:8], DDR_DQM1 |

5.6.2.3.3.9 DDR3 Signal Termination

Signal terminations are required for the CK and ADDR_CTRL net class signals. On-device terminations (ODTs) are required on the DQS[x] and DQ[x] net class signals. Detailed termination specifications are covered in the routing rules in the following sections.

Figure 5-48 provides an example DDR3 schematic with a single 16-bit DDR3 memory device that does not have V_{TT} termination on the address and control signals. A typical DDR3 point-to-point topology may provide acceptable signal integrity without V_{TT} termination. System performance should be verified by performing signal integrity analysis using specific PCB design details before implementing this topology.

5.6.2.3.3.10 DDR_VREF Routing

DDR_VREF is used as a reference by the input buffers of the DDR3 memories as well as the AM335x device. DDR_VREF is intended to be half the DDR3 power supply voltage and is typically generated with a voltage divider connected to the VDDS_DDR power supply. It should be routed as a nominal 20-mil wide trace with 0.1 µF bypass capacitors near each device connection. Narrowing of DDR_VREF is allowed to accommodate routing congestion.

5.6.2.3.3.11 VTT

Like DDR_VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike DDR_VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR_CTRL net class Thevinen terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

5.6.2.3.4 DDR3 CK and ADDR_CTRL Topologies and Routing Definition

The CK and ADDR_CTRL net classes are routed similarly and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR_CTRL. The figures in the following subsections define the terms for the routing specification detailed in Table 5-66.

5.6.2.3.4.1 Two DDR3 Devices

Two DDR3 devices are supported on the DDR3 interface consisting of two x8 DDR3 devices arranged as one 16-bit bank. These two devices may be mounted on a single side of the PCB, or may be mirrored in a pair to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

5.6.2.3.4.1.1 CK and ADDR_CTRL Topologies, Two DDR3 Devices

Figure 5-52 shows the topology of the CK net classes and Figure 5-53 shows the topology for the corresponding ADDR CTRL net classes.

5.6.2.3.5 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

5.6.2.3.5.1 DQS[x] and DQ[x] Topologies, Any Number of Allowed DDR3 Devices

DQS[x] lines are point-to-point differential, and DQ[x] lines are point-to-point singled ended. Figure 5-62 and Figure 5-63 show these topologies.

Figure 5-62. DQS[x] Topology

Figure 5-64. DQS[x] Routing With Any Number of Allowed DDR3 Devices

Figure 5-65. DQ[x] Routing With Any Number of Allowed DDR3 Devices

5.6.2.3.6 Routing Specification

5.6.2.3.6.1 CK and ADDR CTRL Routing Specification

Skew within the CK and ADDR CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the AM335x device and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 5-66 shows this distance for two loads. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK and ADDR_CTRL net class. For CK and ADDR_CTRL routing, these specifications are contained in Table 5-66.

It is very likely that the longest CK and ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK and ADDR_CTRL skew matching and length control.

The length of shorter CK and ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils. The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8

Figure 5-66. CACLM for Two Address Loads on One Side of PCB

Table 5-66. CK and ADDR_CTRL Routing Specification(1)(2)(3)

| NO. | PARAMETER | MIN | TYP MAX | UNIT |

| 19 | Rcp ⁽¹³⁾ | Zo-1 | Zo | Zo+1 | ohms |
| 20 | Rtt ⁽¹³⁾⁽¹⁴⁾ | Zo-5 | Zo | Zo+5 | ohms |

- (1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.
- (2) The use of vias should be minimized.
- (3) Additional bypass capacitors are required when using the VDDS_DDR plane as the reference plane to allow the return current to jump between the VDDS_DDR plane and the ground plane when the net class switches layers at a via.
- (4) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).
- (5) Non-mirrored configuration (all DDR3 memories on same side of PCB).
- (6) While this length can be increased for convenience, its length should be minimized.
- (7) ADDR_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.
- (8) CK net class only.
- (9) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes + 300 mils. For definition, see Section 5.6.2.3.6.1 and Figure 5-66.
- (10) Center-to-center spacing is allowed to fall to minimum (w) for up to 1250 mils of routed length.
- (11) Signals from one DQ net class should be considered other DDR3 traces to another DQ net class.
- (12) CK spacing set to ensure proper differential impedance. Differential impedance should be Z₀ x 2, where Z₀ is the single-ended impedance defined in Table 5-60.
- (13) Source termination (series resistor at driver) is specifically not allowed.
- (14) Termination values should be uniform across the net class.

5.6.2.3.6.2 DQS[x] and DQ[x] Routing Specification

Skew within the DQS[x] and DQ[x] net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS[x] and DQ[x] pin locations on the AM335x device and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 5-67 shows this distance for a two-load case. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS[x] and DQ[x] routing, these specifications are contained in Table 5-67.

There are two DQLMs, one for each byte (16-bit interface). Each DQLM is the longest Manhattan distance of the byte;

therefore:

DQLM0 = DQLMX0 + DQLMY0DQLM1 = DQLMX1 + DQLMY1

Figure 5-67, DQLM for Any Number of Allowed DDR3 Devices

Table 5-67. DQS[x] and DQ[x] Routing Specification(1)(2)

| NO. | PARAMETER | MIN TYP | MAX | UNIT |
|-----|--|---------|-------|------|
| 1 | DQ0 nominal length ⁽³⁾⁽⁴⁾ | 1/3 | DQLM0 | mils |
| 2 | DQ1 nominal length ⁽³⁾⁽⁵⁾ | Die | DQLM1 | mils |
| 3 | DQ[x] skew ⁽⁶⁾ | , | 25 | mils |
| 4 | DQS[x] skew | -31 | 5 | mils |
| 5 | DQS[x]-to-DQ[x] skew ⁽⁶⁾⁽⁷⁾ | | 25 | mils |
| 6 | Center-to-center DQ[x] to other DDR3 trace spacing ⁽⁸⁾⁽⁹⁾ | 4w | | |
| 7 | Center-to-center DQ[x] to other DQ[x] trace spacing ⁽⁸⁾⁽¹⁰⁾ | 3w | | |
| 8 | DQS[x] center-to-center spacing ⁽¹¹⁾ | T. | | |
| 9 | DQS[x] center-to-center spacing to other net ⁽⁸⁾ | 4w | | |

- (1) DQS[x] represents the DQS0 and DQS1 clock net classes, and DQ[x] represents the DQ0 and DQ1 signal net classes.
- (2) External termination disallowed. Data termination should use built-in ODT functionality.
- (3) DQLMn is the longest Manhattan distance of a byte. For definition, see Section 5.6.2.3.6.2 and Figure 5-67.
- (4) DQLM0 is the longest Manhattan length for the DQ0 net class.
- (5) DQLM1 is the longest Manhattan length for the DQ1 net class.
- (6) Length matching is only done within a byte. Length matching across bytes is not required.
- (7) Each DQS clock net class is length matched to its associated DQ signal net class.
- (8) Center-to-center spacing is allowed to fall to minimum for up to 1250 mils of routed length.
- (9) Other DDR3 trace spacing means signals that are not part of the same DQ[x] signal net class.
- (10) This applies to spacing within same DQ[x] signal net class.
- et to e led in Tal (11) DQS[x] pair spacing is set to ensure proper differential impedance. Differential impedance should be Z₀ x 2, where Z₀ is the singleended impedance defined in Table 5-60.

5.7 Inter-Integrated Circuit (I2C)

For more information, see the Inter-Integrated Circuit (I2C) section of the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).

|-----|----------------------------|---|----------|---------------------|-------------------------------------|------|
| NO. | | | MIN | MAX | MIN MAX | UNIT |
| 1 | t _{c(SCL)} | Cycle time, SCL | 10 | | 2.5 | us |
| 2 | t _{su(SCLH-SDAL)} | Setup Time, SCL high before SDA low (for a repeated START condition) | 4.7 | | 0.6 | us |
| 3 | t _{h(SDAL-SCLL)} | Hold time, SCL low after SDA low (for a START and a repeated START condition) | 4 | | 0.6 | us |
| 4 | t _{w(SCLL)} | Pulse duration, SCL low | 4.7 | 1 | 1.3 | us |
| 5 | t _{w(SCLH)} | Pulse duration, SCL high | 4 | _ \ | 0.6 | us |
| 6 | t _{su(SDAV-SCLH)} | Setup time, SDA valid before SCL high | 250 | | 100 ⁽¹⁾ | ns |
| 7 | t _{h(SCLL-SDAV)} | Hold time, SDA valid after SCL low | 0(2) | 3.45 ⁽³⁾ | 0 ⁽²⁾ 0.9 ⁽³⁾ | us |
| 8 | t _{w(SDAH)} | Pulse duration, SDA high between STOP and START conditions | 4.7 | | 1.3 | us |
| 9 | t _{r(SDA)} | Rise time, SDA | W. | 1000 | 300 | ns |
| 10 | t _{r(SCL)} | Rise time, SCL | 7 | 1000 | 300 | ns |
| 11 | t _{f(SDA)} | Fall time, SDA | | 300 | 300 | ns |
| 12 | t _{f(SCL)} | Fall time, SCL | | 300 | 300 | ns |
| 13 | t _{su(SCLH-SDAH)} | Setup time, high before SDA high (for STOP condition) | 4 | | 0.6 | us |
| 14 | t _{w(SP)} | Pulse duration, spike (must be suppressed) | 0 | 50 | 0 50 | ns |

⁽¹⁾ A fast-mode I2C-bus™ device can be used in a standard-mode I2C-bus system, but the requirement t_{su(SDA-SCLH)}≥ 250 ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device stretches the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r max} + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the standard-mode I2C-Bus Specification) before the SCL line is released.

EXAM 2023-11 RM3352 MI (3) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period $[t_{w(SCLL)}]$ of the SCL signal

⁽²⁾ A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL. AN 2023-11 AN 3352 MP1

5.9 LCD Controller (LCDC)

The LCD controller consists of two independent controllers, the raster controller and the LCD interface display driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The raster controller handles the synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale and serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. A built-in DMA engine supplies the graphics data to the raster engine which, in turn, outputs to the external LCD device.
- The LIDD controller supports the asynchronous LCD interface. It provides full-timing programmability of control signals (CS, WE, OE, ALE) and output data.

The maximum resolution for the LCD controller is 2048 x 2048 pixels. The maximum frame rate is determined by the image size in combination with the pixel clock rate.

Frame-to-frame timing is derived through the following parameters in the LCD (RASTER_TIMING_1) register:

- Vertical front porch (VFP)
- Vertical sync pulse width (VSW)
- Vertical back porch (VBP)
- Lines per panel (LPP_B10 + LPP)

Line-to-line timing is derived through the following parameters in the LCD (RASTER_TIMING_0) register:

- Horizontal front porch (HFP)
- Horizontal sync pulse width (HSW)
- Horizontal back porch (HBP)
- Pixels per panel (PPLMSB + PPLLSB)

LCD_AC_BIAS_EN timing is derived through the following parameter in the LCD (RASTER_TIMING_2) register:

AC bias frequency (ACB)

The display format produced in raster mode is shown in Figure 5-81. An entire frame is delivered one line at a time. The first line delivered starts at data pixel (1, 1) and ends at data pixel (P, 1). The last line delivered starts at data pixel (1, L) and ends at data pixel (P, L). The beginning of each new frame is denoted by the activation of IO signal LCD_VSYNC. The beginning of each new line is denoted by the activation of IO signal LCD_HSYNC.

5.10 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and inter-component digital audio interface transmission (DIT).

5.10.1 McASP Device-Specific Information

The device includes two multichannel audio serial port (McASP) interface peripherals (McASP0 and McASP1). The McASP module consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or, alternatively, the transmit and receive sections may be synchronized. The McASP module also includes shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for SPDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP peripheral supports the TDM synchronous serial format.

The McASP module can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format; however, the transmit and receive formats need not be the same. Both the transmit and receive sections of the McASP also support burst mode, which is useful for non-audio data (for example, passing control information between two devices).

The McASP peripheral has additional capability for flexible clock generation and error detection/handling, as well as error management.

The device McASP0 and McASP1 modules have up to four serial data pins each. The McASP FIFO size is 256 bytes and two DMA and two interrupt requests are supported. Buffers are used transparently to better manage DMA, which can be leveraged to manage data flow more efficiently.

For more detailed information on and the functionality of the McASP peripheral, see the Multichannel Audio Serial Port (McASP) section of the AM335x ARM Cortex-A8 Microprocessors (MPUs) Technical Reference Manual (literature number SPRUH73).

5.13.2 UART IrDA Interface

The IrDA module operates in three different modes:

- Slow infrared (SIR) (≤ 115.2 Kbps)
- Medium infrared (MIR) (0.576 Mbps and 1.152 Mbps)
- Fast infrared (FIR) (4 Mbps).

Figure 5-97 illustrates the UART IrDA pulse parameters. Table 5-93 and Table 5-94 list the signaling rates and pulse durations for UART IrDA receive and transmit modes.

Table 5-93. UART IrDA—Signaling Rate and Pulse Duration—Receive Mode

6 Device and Documentation Support

6.1 Device Support

6.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of AM335x device applications:

Software Development Tools: Code Composer Studio[™] Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS[™]), which provides the basic run-time target software needed to support any AM335x device application.

Hardware Development Tools: Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the AM335x microprocessor platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

6.1.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, XAM3358AZCE). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ZCE), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz (for example, 27 is 275 MHz). Figure 6-1 provides a legend for reading the complete device name for any AM335x device.

For orderable part numbers of AM335x devices in the ZCE and ZCZ package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata (literature number SPRZ360).

- A. The AM3358 device shown in this device nomenclature example is one of several valid part numbers for the AM335x family of devices. For orderable device part numbers, see the Package Option Addendum of this document.
- B. BGA = Ball Grid Array.

7 Mechanical Packaging and Orderable Information

7.1 Thermal Data for ZCE and ZCZ Packages

Failure to maintain a junction temperature within the range specified in Table 3-12 reduces operating lifetime, reliability, and performance—and may cause irreversible damage to the system. Therefore, the product design cycle should include thermal analysis to verify the maximum operating junction temperature of the device. It is important this thermal analysis is performed using specific system use cases and conditions. TI provides an application report to aid users in overcoming some of the existing challenges of producing a good thermal design. For more information, see *AM335x Thermal Considerations* (literature number SPRABT1).

Table 7-1 provides thermal characteristics for the packages used on this device.

NOTE

Table 7-1 provides simulation data and may not represent actual use-case values.

Table 7-1. Thermal Resistance Characteristics (PBGA Package) [ZCE and ZCZ]

| NAME | DESCRIPTION | AIR FLOW ⁽¹⁾ | ZCE (°C/W) ⁽²⁾ | ZCZ (°C/W) ⁽²⁾ |
|-----------------|--|----------------------------|------------------------------|------------------------------|

| | | 2.0 | 11.7 | 12.3 |
| | | 3.0 | 11.6 | 12.2 |

⁽¹⁾ m/s = meters per second.

7.2 Via Channel

The ZCE package has been specially engineered with Via Channel[™] technology. This allows larger than normal PCB via and trace sizes and reduced PCB signal layers to be used in a PCB design with the 0.65-mm pitch package, and substantially reduces PCB costs. It allows PCB routing in only two signal layers (four layers total) due to the increased layer efficiency of the Via Channel[™] BGA technology.

Via Channel™ technology implemented on the ZCE package makes it possible to build an AM335x-based product with a 4-layer PCB, but a 4-layer PCB may not meet system performance goals. Therefore, system performance using a 4-layer PCB design must be evaluated during product design.

7.3 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated devices. This data is subject to change without notice and without revision of this document.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free** (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
